U.S. Department of the Interior National Park Service Natural Resource Program Center Fort Collins, Colorado The Natural Resource Publication series addresses natural resource topics that are of interest and applicability to a broad readership in the National Park Service and to others in the management of natural resources, including the scientific community, the public, and the NPS conservation and environmental constituencies. Manuscripts are peer-reviewed to ensure that the information is scientifically credible, technically accurate, appropriately written for the intended audience, and is designed and published in a professional manner.

Natural Resource Technical Reports are the designated medium for disseminating the peer-reviewed results of scientific studies in the physical, biological and social sciences for both the advancement of science and the achievement of the National Park Service's mission. The reports provide contributors with a forum for displaying comprehensive data that are often deleted from journal because of page limitations. Current examples of such reports include the results of research that addresses natural resource management issues; natural resource inventory and monitoring activities; resource assessment reports; scientific literature reviews; and peer reviewed proceedings of technical workshops, conferences, or symposia.

Views, statements, findings, conclusions, recommendations and data in this report are solely those of the author(s) and do not necessarily reflect views and policies of the U.S. Department of the Interior, NPS. Mention of trade names or commercial products does not constitute endorsement or recommendation for use by the National Park Service.

Printed copies of reports in these series may be produced in a limited quantity and they are only available as long as the supply lasts. This report is also available from the Natural Resource Publications Management website (http://www.nature.nps.gov/publications/NRPM) on the internet.

Executive Summary

The Mount Rainier (MORA), North Cascades (NOCA) and Olympic National Parks (OLYM) vegetation classification project was a collaborative effort between the NCCN and the Washington Natural Heritage Program (WNHP) to create a vegetation classification at the association level for these three large parks. The association level is the finest scale of the National Vegetation Classification System (NVC). The system is hierarchical and uses both structural characteristics and species composition to classify vegetation types.

The vegetation classification for these parks was developed to a great extent from existing national, regional and local vegetation classifications. Previous classification work incorporated into this study included: 1) the 2005 coastal forests correlation project (CFCP Meidinger et al. 2005), 2) the 2005 version of the NVC (FDGC 2008, NatureServe 2005) and 3) the WNHP state vegetation classification.

Vegetation plots used in re-enforcing, validating, and developing the classification units included legacy plots collected on the parks, and map assessment plots and plant classification inventory plots collected by NPS field crews between 2005 and 2007. Plot data collected during the course of the project were assigned to previously defined associations and plots not falling within the variation of existing types were used to define new classification units when appropriate

The final classification evaluated 3396 plots: 2479 legacy plots and 917 classification plots from NPS crews. Based on this classification, a total of 311 upland and forested wetland associations are described. Over half (188) of the described associations are tree-dominated, 53 are shrubdominated, 43 are herbaceous-dominated and 27 are sparse vegetation types. Of those associations, forty-nine may occur in the parks based on description from literature in adjacent areas but are not represented by current plot data from within park boundaries. 50 herbaceous and shrub-dominated wetland types are classified separately.

The association descriptions include scientific name, common name, a NatureServe Code when present, acronym (that cross-references to synthesis tables), NVC hierarchy levels including alliance, classification confidence, range in Washington, environmental features, USFWS wetland classification, vegetation description, state conservation rank, rank justification, comments, and plant association synonyms in previous classifications.

Along with the association descriptions, a field key to plant association identification was also generated, with a separate key for the wetland types. Additional supporting information includes synthesis tables of constancy and cover values, and tabular environmental data.

The plant associations described in this report reflect the most current and comprehensive vegetation classification not only for the parks, but for the region. The field keys and descriptions which comprise this report create a new framework for measuring, monitoring and mapping vegetation in the NCCN.

Acknowledgements

This project was completed through the effort and dedication of many individuals and organizations.

Numerous individuals collected plot, observation point, and field data that were incorporated in the classification. We appreciate the hard work of the NPS 2005-2007 vegetation mapping project field crews, which included W. Arneson, J. Chenoweth, W. C. Clark, I. Cunningham, P. Del Zotto, A. Francis, D. Graham, R. Gwodz, M. Immen, S. Johnson, S. Koenig, L. Koepke, M. Lee, C. Meredith, C. Meston, T. Morrison, L. Moulton, A. Nabors, K. O'Neil, G. Pappas, A. Peterson, E. Pruiksma, J. Runge, J. Waite, D. Wallace-Senft and M. Whisman. The NCCN vegetation group S. Acker (OLYM), M. Bivin (NOCA), L. Kurth (MORA), R. Rochefort (NOCA), and L. Whiteaker (MORA) assisted with project oversight, logistics support and reviewing drafts of this report.

NPS Data manager J. Boetsch contributed immeasurably to data management, organization and quality. For the WNHP, database management support and development was skillfully performed by Jack McMillen, particularly preparing data in VPRO (MS Access database) for analysis. The patience and cooperation of both data managers is greatly appreciated.

To these and other contributors to the success of the project, we are grateful.

Funding for this project was provided by the NPS Vegetation Mapping Program and the NPS Fire Program.

Introduction

Vegetation Classification Project

The Mount Rainier (MORA), North Cascades (NOCA) and Olympic National Parks (OLYM) vegetation classification project was organized and coordinated by the North Coast Cascades Network (NCCN) Inventory and Monitoring Program between 2005 and 2008. The purpose of this project was to describe existing plant associations and their environs at MORA, NOCA and OLYM, and to provide this information in written, tabular, and digital formats for vegetation mapping, park resource managers, and others. The basic project components consist of a vegetation classification including descriptions, field key, and supporting synthesis tables of plant associations.

A major purpose of the classification is to provide a platform for future National Park Service (NPS) vegetation mapping for all three parks. The final classification meets the national vegetation standards to the association level and documents the current organization of associations into alliance or other appropriate higher classification levels in anticipation of mapping at these higher levels. In 2005, the NCCN launched a multi-year project to complete vegetation classifications network park units. Project work was coordinated with the USGS-NPS Vegetation Mapping Program and NatureServe. Vegetation plot and observation point data collection occurred between 2005 and 2007. This report documents the methods, results and discussion of the NCCN vegetation classification project.

National Vegetation Classification Standard

This project utilizes the Federal Geographic Data Committee (FGDC 1997, FDGC 2008) - adopted National Vegetation Classification (NVC) standard. The NVC evolved from work conducted primarily by The Nature Conservancy (TNC), NatureServe, and the Natural Heritage Program network over more than two decades (Grossman et al. 1998). The structure of the NVC is based in part on an earlier international vegetation classification developed by the United Nations Educational, Cultural, and Scientific Organization (UNESCO 1973, Driscoll et al. 1984). Use of a standardized classification system helps to ensure data compatibility throughout the National Park Service and other agencies. The FGDC Vegetation Subcommittee continues to keep the NVC standard current and relevant. Substantial revisions to the upper levels of the NVC hierarchy were adopted by the FGDC in February 2008 (FDGC 2008).

Vegetation classification systems attempt to recognize and describe repeating assemblages of plants in similar habitats. The NVC (FGDC 1997) is a hierarchical system. The seven levels in the terrestrial vegetation classification are defined by both physiognomic characters and floristic criteria. The five upper levels (class, subclass, group, subgroup, and formation) are primarily based on physiognomic features. They have a broad geographic perspective and the floristic units have utility in local and site-specific applications (Grossman et al. 1998). Upper, physiognomic levels additionally contain physical, structural, and environmental characteristics identifiable from satellite imagery, aerial photography, or ground observations. In contrast to the upper levels, differences in floristic composition distinguish the two lowest levels of the 1997 NVC, alliance and association. The alliance and association levels form the base of the NVC hierarchy and are determined by the most abundant or diagnostic species comprising the various layers of a

homogenous vegetation community. Species composition differentiates associations. An alliance is a physiognomically uniform group of associations sharing one or more diagnostic (dominant, differential, indicator, or character) species which, as a rule, are found in the uppermost stratum of the vegetation. (FDGC 1997). An association is defined as a plant community type with a consistent species composition, uniform physiognomy, and similar habitat conditions (Flahault and Schroter 1910).

The 2008 FGDC standard substantially revises the 1997 hierarchy. As stated in the 2008 standard (FGDC 2008):

"The revised hierarchy addresses the following issues, among others: a) uses vegetation criteria to define all types (de-emphasizing abiotic criteria, such as hydrologic regimes in wetland types), b) provides a clear distinction between natural and cultural vegetation wherever these can be observed from broad growth form patterns (rather than combining natural and cultural vegetation initially and separating them at lower levels), c) for natural wherever these can be vegetation, defines the upper levels based on broad growth form patterns that reflect ecological relationships (rather than detailed structural criteria, which are more appropriate lower down in the hierarchy), d) provides a new set of middle-level natural units that bridge the large conceptual gap between alliance and formation, e) integrates the physiognomic and floristic hierarchy levels based on ecologic vegetation patterns, rather than developing the physiognomic and floristic levels independently and then forcing them into a hierarchy, f) provides detailed standards for plot data collection, type description and classification, data management and peer review of natural vegetation, and g) for cultural vegetation provides an independent set of levels that addresses the particular needs of cultural vegetation."

The 2008 natural vegetation hierarchy consists of eight levels, organized into three upper levels that include levels 1 through 5 in the 1997 standard, three middle levels not in the 1997 levels, and the same two lower levels as in the 1997. The FGDC 2008 standard fully discusses the rationale and criteria of each hierarchy level which are summarized in Table 1 (http://www.fgdc.gov/standards/projects/FGDC-standards-projects/vegetation/NVCS V2_FINAL_2008-02.pdf). In general, dominant growth form is more important in upper levels and diagnostic species and composition are more important in lower levels. The new middle level consider biogeographic and mesoclimatic factors along with diagnostic species and life forms.

Table 1. Criteria and rationale applied to each hierarchical level in the 2008 FGDC vegetation classification standard.

Hierarchy Level	Criteria	
Upper:	Physiognomy plays a predominant role.	
L1 – Formation Class	Broad combinations of general dominant growth forms that are adapted to basic	
Example – Mesomorphic	temperature (energy budget), moisture, and substrate/aquatic conditions.	
Tree Vegetation		
L2 - Formation Subclass	Combinations of general dominant and diagnostic growth forms that reflect global	
Example –Temperate	macroclimatic factors driven primarily by latitude and continental position, or that	
Forest	reflect overriding substrate/aquatic conditions.	
L3 – Formation	Combinations of dominant and diagnostic growth forms that reflect global	
Example- Cool Temperate	macroclimatic factors as modified by altitude, seasonality of precipitation, substrates,	
Forest	and hydrologic conditions.	
Middle:	Floristics and physiognomy play predominant roles	
L4 – Division	Combinations of dominant and diagnostic growth forms and a broad set of diagnostic	
Example – Western	plant species that reflect biogeographic differences in composition and continental	
North American Cool	differences in mesoclimate, geology, substrates, hydrology, and disturbance regimes.	
Temperate Forest		
L5 – Macrogroup	Combinations of moderate sets of diagnostic plant species and diagnostic growth	
Example - Vancouverian	forms, that reflect biogeographic differences in composition and sub-continental to	
Lowland and Montane	regional differences in mesoclimate, geology, substrates, hydrology, and disturbance	
Rainforest	regimes.	
L6 – Group	Combinations of relatively narrow sets of diagnostic plant species (including	
Example - North Pacific	dominants and co-dominants), broadly similar composition, and diagnostic growth	
Maritime Douglas-fir-	forms that reflect regional mesoclimate, geology, substrates, hydrology and	
Western Hemlock Forest	disturbance regimes.	
Lower:	Floristics plays a predominant role	
L7 – Alliance	Diagnostic species, including some from the dominant growth form or layer, and	
	moderately similar composition that reflect regional to subregional climate, substrates,	
	hydrology, moisture/nutrient factors, and disturbance regimes.	
L8 – Association	Diagnostic species, usually from multiple growth forms or layers, and more narrowly	
	similar composition that reflect topo-edaphic climate, substrates, hydrology, and	
	disturbance regimes.	

The alliance and association levels of the revised hierarchy are essentially the same as the 1997 FGDC hierarchy. However, the distinctions between these two lower levels and the levels above have been clarified. The 2008 standard provides the following expanded definitions (FDGC 2008):

Alliance: A vegetation classification unit of low rank (7th level) containing one or more associations, and defined by a characteristic range of species composition, habitat conditions, physiognomy, and diagnostic species, typically at least one of which is found in the uppermost or dominant stratum of the vegetation (Jennings et al. 2006). Alliances reflect regional to subregional climate, substrates, hydrology, moisture/nutrient factors, and disturbance regimes.

Association: A vegetation classification unit of low rank (8th level) defined on the basis of a characteristic range of species composition, diagnostic species occurrence, habitat conditions and physiognomy (Jennings et al. 2006). Associations reflect topo-edaphic climate, substrates, hydrology, and disturbance regimes.

NatureServe coordinates plant association data for the NPS vegetation mapping projects. Associations are added to the NVC and older concepts are refined as new data become available. Modifications to the NVC hierarchy are currently managed by NatureServe.

Project Overview

General Approach and Timeline

The vegetation classification for these parks was developed to a great extent from existing national, regional and local vegetation classifications. Plot data collected during the course of the project were assigned to previously defined associations and plots not falling within the variation of existing types were used to define new classification units when appropriate. Vegetation plots used in re-enforcing, validating, and developing the classification units included legacy plots collected on the parks, and map assessment plots and plant classification inventory plots collected by NPS field crews between 2005 and 2007. A preliminary classification was developed in 2005, and applied by field crews. NPS field data and legacy plot data were incorporated in 2006. NPS field crews directed efforts to fill known gaps in regional and local classifications and in legacy data during the 2006 and 2007 field seasons. The classification was modified following each field season and then used and verified by field crews in the following year. The overall sampling density is relatively limited considering the large areas encompassed by these parks, representing 1 plot per approximately 670 acres, although all major vegetation types were sampled. The final classification was completed in 2009.

Primary Partners and Project Roles

This project was a collaborative endeavor between the National Park Service, North Coast Cascades Network Inventory and Monitoring Program and the Washington Natural Heritage Program. NatureServe has also played a role. The NCCN staff generated the initial proposal for funding the three year project. NPS provided project oversight, field staff, developed a field data protocol and created and maintained the database used to store and manage plot data. The WNHP was selected as a partner for the classification analysis because of their extensive work to develop classifications of native plant communities throughout Washington State. WHNP staff has extensive experience in all phases of development of vegetation classifications and employs the same national system of classification used by the NPS. Thus, the project advances the objectives of both NPS and WNHP, and takes advantage of the strengths of both organizations. The WNHP was responsible for analyzing field data, updating the draft classification annually and preparing the final report. In 2008, NatureServe joined the effort and was primarily responsible for developing the upper levels of classification in the context of the new hierarchy.

Study Area

Location and Setting

Mount Rainier, North Cascades, and Olympic National Parks are located in western Washington. Regionally, these parks occur in the coastal ranges in the Pacific Northwest: the Cascade and Olympic Mountains. All three parks are primarily montane forest environments, however each park hosts unique features discussed in sections below. While occurring in the same broader setting, each park does contain unique characteristics due to differences in geological history, local climate, and past land use. These differences are reflected in the ecoregions in which each park resides (Figure 1).

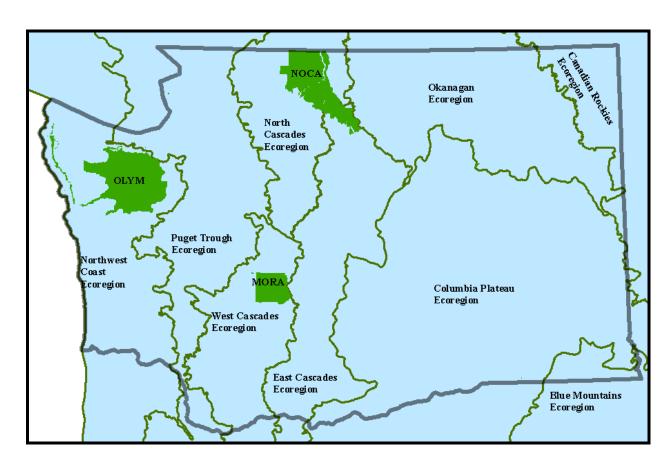

Figure 1. Location of Mount Rainier (MORA), North Cascades Complex (NOCA), and Olympic National Parks with respect to the eight ecoregions of Washington State.

Mount Rainier National Park

Mount Rainier National Park (MORA), the nation's fifth national park, was established by an act of Congress in 1899 (NPS 2008a). MORA boundaries encompass 235,625 acres entirely west of the Cascade Range crest. The park is located in Pierce and Lewis counties, about 50 miles southeast of the Seattle-Tacoma metropolitan area (NPS 2008a; Figure 1). National Forest lands, including four wilderness areas, surround MORA to the north, east, and south while private lands occur to the west, much of which has been intensively logged (Biek 2000).

MORA is in the West Cascades ecoregion which, in Washington, includes the Cascade Mountains south of Snoqualmie Pass and west of the Pacific crest to the Oregon border (Figure 1) (WADNR 2007). The ecoregion extends southward to the Oregon-California border. Typical elevation range of the West Cascades is 500 to 7,000 feet with Mount Rainier (14,410 feet) as the high point and Columbia River Gorge (50 feet) as the lowest elevation. Mount Rainier, an active volcano that last erupted approximately 150 years ago, is the most prominent peak in the Cascade Range and dominates the landscape of a large part of western Washington State (NPS 2008a).

North Cascades National Park Service Complex

The U.S. Congress established North Cascades National Park Service Complex (NOCA) in 1968 to preserve "certain majestic mountain scenery, snowfields, glaciers, alpine meadows, lakes and other unique glaciated features" ... "for the benefit, use and inspiration of present and future generations" (NPS 2008b). NOCA includes 684,237 acres of federally protected land near the crest of the Cascade Mountains from the Canadian border south to Lake Chelan (Figure 1). NOCA is approximately 62 miles (100 km) long and 31 miles (50 km) wide (Agee and Kertis 1987). NOCA was envisioned primarily as a wilderness park and 634,614 acres, or 93%, of the complex has been designated as the Stephen Mather Wilderness Area (NPS 2008b). NOCA is the core of over 2 million acres of federally designated wilderness in north-central Washington and is one of the largest such areas in the lower 48 states (NPS 2008b).

NOCA is in the North Cascades ecoregion which includes the Cascades Mountains north of Snoqualmie Pass and west of the Pacific Crest and extends into British Columbia (Figure 1). Most of the ecoregion lies between 1,000 and 7,000 feet elevation with the highest peaks rising to over 10,000 feet and valley bottoms at 500 feet (WADNR 2007). These mountains contain various metasedimentary rocks and display many glacially carved U-shaped valleys and cirques and a few volcanic peaks.

Olympic National Park

Olympic National Park (OLYM) was created in 1938 and covers 922,651 acres that span a rich and varied terrain. OLYM includes an outer coast strip comprised of rocky shorelines, beaches and coastal forests as well as one of the richest old-growth forests in the world (McNulty 2003). The Park is located on the Olympic Peninsula in northwestern Washington and is surrounded by Olympic National Forest and Washington Department of Natural Resource lands (Figure 1). OLYM is in the Northwest Coast ecoregion which includes the coast ranges from Oregon north to Vancouver Island, British Columbia (Figure 1). The Olympic Peninsula is bordered by the Pacific Ocean to the west, the Strait of Juan de Fuca to the north, and Hood Canal to the east while the southern flanks adjoin the lowlands of Grays Harbor basin (WADNR 2008).

Geology

The geologic history of each park shapes current vegetation patterns through its effects on topography, soils, and disturbance regimes. The following provides a brief geological history of the region and then specific geological processes related to vegetation patterns for each park.

Collision and accretion of terranes and volcanic activity at the leading contact of the North American plate underlie the geological history of the three national parks (Williams 2002). About 150 million years ago, the western edge of the North American continent, located approximately where Idaho, Oregon, and Washington meet today, began to collide with the easterly track of the Pacific plate resulting in the "docking" of new rocks to the North American continent (i.e. Superterrane I) and thereby extending the western edge of North America into eastern British Columbia and northeastern Washington (Williams 2002). About 50 million years ago, Superterrane II docked against the Superterrane I rocks extending the edge of the North American continent into most of contemporary British Columbia and northern Washington, including the area now occupied by NOCA (Williams 2002). Approximately 20-30 million years ago, as the San Juan de Fuca plate subducted under North America, ocean floor basalts and their overlying sediments began pushing up against the North American plate and were uplifted to form the Olympic Mountains (Williams 2002).

As the subduction of the Pacific oceanic plate continued under North America, a series of volcanic eruptions began creating the foundation of the Cascade Mountains around 40 to 17 million years ago. Around nine million years ago, uplift of this foundation along with renewed volcanic activity built and continues to build the contemporary Cascade Range (Williams 2002). Granitic rocks and welded fragmental volcanic rocks resistant to erosion now comprise many of the higher peaks in the South Cascades (Pringle 2008). The character series of stratovolcanoes, a large, steep volcano built up of alternating layers of lava and ash or cinders also called composite volcanos, currently found in the Cascade Range including Mount Rainier (the oldest in Washington), Mount St. Helens, and Mount Adams, emerged through and built atop the older volcanic Cascades. More northerly stratovolcanoes such as Mount Baker and Glacier Peak emerged through the older landscapes in the North Cascades (Williams 2002).

Erosive actions of gravity, wind and water erosion have steadily modified the mountains resulting in the steep topography of contemporary landscapes. Glaciation is a major modifier of landscapes and during the ice age the development and movement of ice and ice melt had great effects on the coastal and Cascade ranges. Alpine glaciers modified and continue modify the Cascades and the Olympic Mountains. The last maximum ice advanced 14,000 years ago during which the Canadian continental ice sheet covered the North Cascades and advanced to surround the Olympics on the east and north.

Mount Rainier National Park

Mount Rainier is a stratovolcano in the volcanic-arc that forms the Cascade Mountains. It is situated 15 miles east of the Cascade Crest where the range is 60 to 90 miles wide (Pringle 2008). At 14,410 feet, Mount Rainier is superimposed on the eroded foundation of the older volcanic, intrusive, and sedimentary rock of the Cascade Mountains (Pringle 2008). The pyroclastic cone of Mount Rainier began forming approximately one million years ago. About 700,000 years ago, eruptions of andesitic flows began rapidly building the mountain even higher. Relatively recent eruptions (between 6,600 and 5,700 years ago) have modified the morphology of the summit. In the last 10,000 years, Mount Rainier has been estimated to have erupted more than 40 times (Pringle 2008). Early settlers noted eruptions of the volcano between 1820 and 1894 (Pringle 2008). Such volcanic activity has a large impact on vegetation patterns as a result of direct disturbances and subsequent effects on soil development and drainage patterns as

documented at Mount Helens (Dale et al. 2005). For example, these eruptions have been the source of numerous mudflows (or lahars) which have flowed down the mountain's major river drainages. Since Pleistocene glaciations, more than 60 lahars are thought to have flooded these river valleys (Pringle 2008). These lahars typically destroy much of the vegetation within their path. Forest development soon initiates following these events. The lahars also restructure the geomorphology of the drainages and thus the template upon which valley bottom vegetation develops. Gigantic rock avalanches and other mass wasting events such as rock and talus slides are other geologic disturbances affecting vegetation patterns (WADNR 2008). These events can destroy existing vegetation and set the template for future vegetation development. Volcaniclastic deposits effect soil characteristics such as porosity and nutrients. In relation to these geologic events, vegetation patterns are correlated to soil drainage characteristics and time since the last.

Glaciation has had an important role in eroding the mountain and many of the contemporary river valleys at MORA (Pringle 2008; WADNR 2008). Mountain glaciations have occurred repeatedly over the last 120,000 years. Glacial action, glacial outwash, and alluvial landforms all have a significant effect on contemporary vegetation patterns (Franklin et al. 1988). The variety of geomorphic templates, soil textures, and resulting drainage patterns has a profound influence on the type of vegetation that develops in areas affected by past glaciations.

North Cascades National Park Service Complex

North Cascades National Park is embedded in the Cascade Range, a vast mountain chain that extends from northern California to British Columbia (WADNR 2008; Tabor and Haugerud 1999). The Cascade Mountains consist of an active volcanic arc superimposed upon Paleozoic to Tertiary age bedrock. From the Pliocene (5 to 2 million years ago) to the recent, uplift has created high topographic relief around the active volcanoes (WADNR 2008). The vertical distance from valley floor to the North Cascade peaks ranges between 4,000 to 6,000 feet making the North Cascades one of the steepest mountain ranges in the conterminous United States (Tabor and Haugerud 1999). A complex mix of volcanic arcs, deep ocean sediments, basaltic ocean floor, ancient continents, and submarine fans create the geologic foundation of the North Cascades (Tabor and Haugerud 1999; WADNR 2008). Subsequent uplift, erosion, metamorphosis, plutonic intrusion, additional uplift, and the formation of volcanic arc modified these pieces into the contemporary geologic mosaic that currently comprises the North Cascades (Tabor and Haugerud 1999). Two Quaternary stratovolcanoes, Mount Baker at 10,781 feet and the second most active volcano in Washington and Glacier Peak at 10,451 feet, rise above and dominate the volcanic arc which formed in the North Cascades (WADNR 2008). Both volcanoes are thought to be less than one million years old. Glaciations, landslides, and fluvial erosion have created the steep terrain, jagged peaks, and deep canyons currently found in the North Cascades (Tabor and Haugerud 1999). Past volcanism, uplift, and mass wasting have been both a destructive and creative force in the development of vegetation patterns in NOCA.

During the Holocene glaciations, the Cordilleran Ice Sheet flowed over most of the North Cascade range and greatly modified the North Cascade landscape. Today, the North Cascades has over 300 glaciers and contain the greatest concentration of alpine glaciers in the conterminous United States (over half of those found in the lower 48 states) (WADNR 2008;

NPS 2008b). Glacial landforms such as eroded valleys, till, glacial outwash, and alluvial landforms have a significant determinant of the type of vegetation.

Olympic National Park

The Olympic Mountains, within which Olympic National Park is mostly embedded, form the core of the Olympic Peninsula. The Olympic Mountains were formed from the uplift of sedimentary (e.g. sandstones, mudstones, and shales) and volcanic rocks which were deposited over millions of years on a seafloor off the continental shelf (McNulty 2003). During the middle to late Miocene (18-9 million years ago), as these sedimentary and volcanic rocks were carried by the Farallon plate toward the North American continent, some were uplifted instead of subducted underneath the North American plate (Alt and Hyndman 2001; WADNR 2008; McNulty 2003). This collision caused the uplifted sedimentary rocks to be forced underneath and behind the uplifted basalts on the eastward edge of the Farallon plate (Henderson et al. 1989; McNulty 2003). Those sedimentary rocks which were subducted were subject to metamorphism resulting in the formation of semischist, slate, and phyllite (McNulty 2003). The basalts were forced into their present day horseshoe-like distribution around the eastern edge of the Olympics.

Pleistocene glaciations, associated with both alpine and continental ice, dramatically eroded the Olympic Mountains into the jagged, steep topography characteristic of the contemporary landscape (McNulty 2003). Alpine glaciers tended to further erode drainages already begun by fluvial erosion resulting in a widening, straightening, and flattening of preexisting river valleys into characteristic U-shaped valleys. The headwaters of these glaciated valleys are often very steep and jagged. Continental ice sheets descended into western Washington numerous times during the Pleistocene (McNulty 2003). These ice advances wrapped around the northern and eastern base of the Olympic Mountains and, along with outwash streams flowing around the southern flank of the mountains effectively isolated the Olympics from nearby landforms. This isolation resulted in the Olympic Mountains serving as a refugium during the Ice Age for many species, especially plants (McNulty 2003; Buckingham et al. 1995). The northern and eastern lobes of the continental ice dammed many of the rivers draining off of the Olympic Mountains creating fjord-like lakes in the river valleys. As with the other two parks, uplift and glaciations have had dramatic effects on vegetation patterns in the OLYM. Unlike the other two parks, volcanism is not a part of OLYM geologic history.

A portion of the OLYM also occurs along the rocky coast of the Olympic Peninsula. During the Oligocene and early Miocene (50-18 million years ago), deposition of marine nearshore clastic sediments occurred around the periphery of the Olympic Peninsula (WADNR 2008). Erosion-resistant sandstones and conglomerates today form the characteristic islands, sea stacks, and headlands along the western coastline of the Olympic Peninsula (WADNR 2008; McNulty 2003).

Climate

Pacific Northwest climate is created by the interactions between seasonally varying weather and the region's mountain ranges (Climate Impact Group 2008). Winter rain and snow and summer drought characterize the temperate, maritime climate of the Pacific Northwest. High pressure systems which develop in the Pacific Ocean have a strong influence on the seasonal tracks of precipitation. Typically, two-thirds of the precipitation occurs between October and March when

the Pacific high pressure system moves south allowing low pressure systems to approach from the Pacific Ocean on the dominant westerlies (Franklin and Dyrness 1998). During that time the Pacific storm track brings frequent rain in the lowlands and snow in the mountains. Mount Rainier and Mount Baker vie for the honor of receiving the most snow than anywhere else on earth. A high pressure area develops off the coast of Oregon and Washington and, when persistent, generally keeps the Pacific Northwest fairly dry during late spring into early fall.

Climate in the low elevations west of the Cascades is characterized by mild year-round temperatures, abundant winter rains, and dry summers. Average annual precipitation in most places west of the Cascades is more than 30 inches. The western slopes of the Olympic and Coast mountain ranges typically receive about 118 inches per year, with some locations on the Olympic Peninsula exceeding 200 inches per year. Average annual precipitation in the Cascades typically exceeds 100 inches or more.

The Cascade and Olympic mountains are barriers to eastward moving storms resulting in rainshadow development on the eastside of the mountains, sometimes significantly reducing precipitation. The Olympic rainshadow is the most dramatic with 119 inches average annual precipitation at Point Grenville on the Pacific Coast, over 200 inches/year at Mount Olympus 45 miles to the northeast and 17 inches/year at Sequim another 30 miles northeast in the rainshadow. Equally important are rainshadows at Mount Rainier, Mount Baker and in the North Cascades. Temperatures are also lower and the number of sunshine days is greater on the east side of the Cascade Crest

Mount Rainier National Park

Climate varies with elevation and local topography. At lower elevations (mostly below 3,000 feet) mild temperatures occur year round and rain is the major form of precipitation. Mean annual precipitation is near 59 inches while mean winter temperatures are near 32°F and mean summer temperatures 79^o F (Franklin and Dyrness 1988). The highest amount of annual rainfall in MORA occurs in this elevation zone in the northwest part of the park (e.g. Carbon River valley) where 180-210 inches of rainfall produces rainforests similar to those found on the Olympic Peninsula (Biek 2000). Between 2,500 and 4,700 feet, climate is predominantly temperate and receives an annual precipitation of approximately 102 inches, considerably more precipitation than lower elevations, and much of which falls as snow, an average annual of approximately 28 feet (Franklin and Dyrness 1998). Another climatic characteristic of this elevation zone is the occasional rain-on-snow events which can occur during winter months. Mean annual summer temperatures are near 58°F and mean winter temperatures near 26°F. Over 4,000 feet elevation, cold temperatures and snowfall define the climatic regime of the subalpine. At the Paradise Ranger Station in MORA, summer temperatures average 52°F while winter temperatures 26°F. Mean annual precipitation at Paradise is 104 inches (Franklin and Dyrness 1988). Snow depths average more than 50 feet at Paradise (Biek 2000). In 1971-1972, the second highest world record for annual snowfall occurred at Paradise with an accumulation of 93 feet. This amount held the world record until 1999, when annual snowfall at Mount Baker surpassed it by a few inches (NOAA 2008). In the northeast portion of MORA, where Mount Rainier creates a rainshadow, the subalpine is slightly drier and colder version than other subalpine areas in the park. Cold winters, deep snowpack, and cool summers characterize these areas (Franklin and Dyrness 1988). The climate in these areas is more characteristic of high elevations in eastern Washington. Above the subalpine (usually above 6,000 feet) temperatures become extremely

cold and at the highest elevations, where year round cold temperatures predominate and snowfall exceeds snowmelt, glaciers and permanent ice have formed.

Special microclimates generated by local landforms and weather patterns also influence vegetation patterns (Biek 2000). For example, snow depth can be limited in alpine areas and ridgelines due to desiccating winds producing drier vegetation patterns that might otherwise be expected. Conversely, during summer months when precipitation is sparse, fog and clouds can be important sources of moisture for some forest types along high ridges (Biek 2000). Aspect also plays a strong role in the development of microclimates. Cold-air drainage off of snowfields or down into valleys has a large influence on local climate.

North Cascades National Park Service Complex

Climate in the North Cascade National Park Service Complex (NOCA) varies greatly between the western and eastern portion of the complex due to the barrier imposed by the North Cascade range on westerly storms. Average annual snowfall also varies with approximately 70 inches in western lowlands, 516 inches at high elevations west of the Cascade crest, to 123 inches at Stehekin on Lake Chelan (Douglas 1969). As mentioned above, the world record for annual snowfall was recently recorded at Mount Baker with over 93 feet of snowfall (NOAA 2008). Precipitation is seasonally distributed with the majority of the total annual precipitation falling between late fall and early spring.

Precipitation at low elevations mostly consists of rain, high elevations have significant snowpack for many months, and middle elevations have significant snowpack which fluctuates over the course of the winter due to rain-on-snow events (Iachetti et al. 2006). However, due to the width of the North Cascades, the rainshadow effect develops west of the Cascade crest in contrast to the southern Cascades where rainshadows are typically observed east of the Cascade crest (except rainshadow effects due to the much larger stratovolcanoes such as Mount Rainier). Temperatures also vary from west to east with colder winters and warmer summers occurring in the eastern portion of the NOCA (Agee and Kertis 1987). Local rainshadow effects, aspect, and cold-air drainage also create microclimates. For example, an average of 100 inches precipitation falls at Upper Baker Dam while only 35 inches accumulates on Desolation Peak on Ross Lake, 25 miles to the east.

Olympic National Park

The climate of Olympic National Park (OLYM) varies according to elevation and location on the peninsula. The Olympic Mountains create a very strong rainshadow resulting in drastic changes in precipitation within only 25 miles. Over 200 inches of annual precipitation falls on the west side of the Olympic crest while only 20 inches occurs in the northeast portion of the peninsula (e.g. near Sequim) due to an intense rainshadow effect (Henderson et al. 1989). This is one of the steepest precipitation gradients in the world with only 34 miles separating the wettest location in the continental United States from the driest location along the Pacific coast, north of southern California (Buckingham et al. 1995). As with the other two parks, the seasonal movement of high pressure systems produces a wet-dry climatic cycle. Starting in late fall and continuing through early spring, southwesterly storms bring wet, mild weather to OLYM (Henderson et al. 1989). As these storms hit the Olympic Mountains and begin to rise, the moisture laden airs begins to drop much of its moisture. By the time these storms pass over the mountains they have

lost much of their moisture resulting in a dramatic drop in annual precipitation in the northeastern part of the Olympic Peninsula. The wettest areas of OLYM occur at the highest elevations and in the southwest corner of the Park while the driest areas occur in the northeast. About 93% of annual precipitation falls between September and May leaving the summer months relatively dry (Henderson et al. 1989).

Rain is the predominant form of precipitation below approximately 985 feet elevation. Coastal areas in OLYM have the mildest climate in the Pacific Northwest, meaning it has the least amount of variation in temperature and moisture than other areas (Franklin and Dyrness 1988). Along the coast, annual precipitation averages between 79-118 inches and frequent fog and low clouds occur during the relatively drier summer months (Franklin and Dyrness 1988). Rain and snow are predominant between 985 to 2460 feet and snow is the major form of precipitation at higher elevations (Buckingham et al. 1995). Snow depth can reach over 20 feet in subalpine meadows (Henderson et al. 1989)

Soils

Soil formation is controlled by five factors: climate, organisms, relief, parent material, and time (Jenny 1941). These factors are quite variable across the three parks resulting in a diversity of soil types with unique chemical and physical properties such as moisture and nutrient availability. Extensive mapping and classification has not been conducted by the Natural Resources and Conservation Service within the parks thus much of this discussion is limited to broad patterns observed in each park.

Five major Soil Orders can be identified as likely being the most common in the three parks (Soil Conservation Service 1994; Henderson et al. 1989). These include: (1) Spodosols which form in coarse-texture, acid, parent material, are subject to leaching, and are commonly found underneath forest vegetation. Except for drier areas (e.g. areas within rainshadows), conditions favorable for Spodosol development exist in most areas of the three parks (Henderson et al. 1989); (2) Inceptisols are immature soils which show a moderate degree of soil development but not enough to show equilibrium with the environment in which they are found. In other words, with more time they will develop into another Soil Order. Inceptisols are likely very common throughout the region; (3) Entisols are the youngest and least developed soils. Two major types are recognized: Orthents, which develop on colluvium such as recently eroded slopes, landslides, etc. and Fluvents, which are common in floodplains; (4) Histosols are organic soils formed when organic matter accumulation is greater than decomposition due to anaerobic condition. Histosol are found in bogs, fens, and along some streams; and (5) Andisols, which are soils developed in volcanic ejecta (Henderson et al. 1989). Another characteristic of high elevation soils is the development of cryptobiotic soil crusts which bind soils particles together thereby increasing soil stability, increasing infiltration, reducing erosion, and aiding vegetation establishment via an increase in available nutrients and water for plants (NPS 2005).

In addition to the general patterns just described, each of the matrix forest Groups (see Vegetation section below) exhibit some common soil features. The North Pacific Maritime Douglas-fir-Western Hemlock Forest Group generally has moderately deep soils (shallower on steep slopes) that are of medium acidity, well aggregated, sandy loam to clay loam in texture, moderate (e.g. Cascades) to high (Olympic Peninsula) organic matter, and forest floors or O

horizons 3-6 inches deep (Franklin and Dyrness 1988). Soils in the North Pacific Mesic Western Hemlock-Silver Fir Forest Group are often exhibit podzolization, meaning Spodosols are quite common. Forest floor depths range from 1-3 inches and in northern Washington can reach up to 12 inches (Franklin and Dyrness 1988). Spodosols are also quite common in the North Pacific Mountain Hemlock-Silver Fir Forest and Tree Island Group but the degree of podzolization varies greatly. Forest floor depths range from 2-4 inches (Franklin and Dyrness 1988). Soils in the Northern Rocky Mountain Whitebark-Limber Pine Woodland Group are also mostly Spodosols but generally have thinner forest floor depths than those found in the North Pacific Mountain Hemlock-Silver Fir Forest and Tree Island Group (Franklin and Dyrness 1988).

Mount Rainier National Park

Hobson (1976; as cited in NPS 2005) developed a soils classification for MORA based on geological origin, topography, and drainage features. According to this classification, four major soil groups support forests at MORA: (1) Tephra soils are derived from pyroclastic deposits. These are common in the subalpine and alpine meadows as well as in forests throughout the park (Franklin et al. 1988). According to Keys to Soil Taxonomy these soils would be classified as Andisols (Soil Conservation Service 1994); (2) Colluvial soils consist of coarse, unconsolidated material from a variety of sources. These soils are typically found on slopes at all elevations, especially on steep slopes and south-facing aspects. Younger colluvial soils would most likely be classified as Orthents and older soils could vary in type such as Inceptisols or Spodosols (Soil Conservation Service 1994); (3) Alluvial soils form from fluvial deposition resulting from historic glacial floods and contemporary flooding regimes. Thus, alluvial soils are found along stream and river valleys and alluvial slopes and fans (NPS 2005). More recent alluvium would be classified as Fluvents while older deposition could vary depending on moisture regime and vegetation (Soil Conservation Service 1994); and (4) Mudflow soils are derived from lahars and consist of a mixture of tephra, alluvium, and colluvium (NPS 2005). Many forest soils are classified as Spodosols. Histosols are found in bogs and fens and possibly along some streams at high elevations (Franklin et al. 1988). Many areas in the subalpine and alpine consist of bare rock and talus slopes with no soil development. Heavy recreation use in many subalpine meadows is resulting in the destruction of the cryptobiotic soil crust resulting in increased bare ground and erosion in many of these areas (NPS 2005).

North Cascades National Park Service Complex

The Natural Resources Conservation Service is currently mapping soils in NOCA (Toby Rogers, NRCS, personal communication 2009). Andisols and Spodosols are major soils and are associated with older soils. Andisols are formed from volcanic ash and posses what are called andic properties (high water-holding capacity and ability to fix and make unavailable to plants, phosphorous.) Younger soils, such as Inceptisols and Entisols, are typically associated with recently eroded slopes, riparian environments, landslides, etc. and are less influenced by volcanic ash since the origin these soils post-date past volcanic eruptions which deposited appreciable amounts of ash. As with much of the montane forest of western Washington, Spodosols are likely a common soil type underneath forests, Histosols are to be found in bogs and fens, Entisols are expected in areas recently exposed to erosion (Orthents) or deposition (Fluvents), Inceptisols are likely common in many forests, and Andisols may be associated with past volcanic eruptions.

Olympic National Park

Soil patterns for OLYM are briefly described here. More detailed discussion can be obtained in Henderson et al. (1989). As with the other two parks, soils have not been explicitly classified or mapped for OLYM. Complex geology, glacial history, range of precipitation, and a variety of relief have resulted in a rich diversity of soil types with many of the same general patterns described above for MORA (Henderson et al. 1989; NPS 2005). Spodosols and Inceptisols are common Soil Orders underneath forest within OLYM. Most Inceptisols on the Olympic Peninsula are likely developing toward Spodosols (Henderson et al. 1989). Orthents are common on colluvium and Fluvents are a common soil type along floodplains. Histosols are found in bogs and fens. Andisols are likely found in the OLYM as well but their extent is less clear (Henderson et al. 1989).

Hydrology and Water Resources

The variety of water resources found in each park is briefly described below.

Mount Rainier National Park

Approximately 400 lakes, 470 streams, several mineral and thermal springs, and about 3,000 acres of wetlands have been mapped at MORA (NPS 2008a). These aquatic resources support a diversity of plant and animal species and are critical habitat for several native amphibian and fish species, eight which are listed as endangered, threatened, or species of concern (NPS 2008a). In addition, other wildlife species are dependent on these aquatic ecosystems for a portion of their life cycle. Of the nine major rivers and their tributaries in the park, the Nisqually, Puyallup, Mowich, Carbon, West Fork, White, and Muddy Fork rivers are supported by seasonal precipitation and the mountain's 26 major glaciers (covering 35 square miles). The Ohanapecosh and Huckleberry drainages do not originated with glacial melt-water. All the park's rivers flow into Puget Sound near Tacoma, Washington except the Muddy Fork and Ohanapecosh Rivers that flow into the Cowlitz River and eventually into the Columbia River (NPS 2008a). Hot springs are found at Ohanapecosh and on mountain slopes near Paradise and Winthrop glaciers, a thermal lake is found in the firn caves on Mount Rainier's summit crater, and a mineral spring at Longmire (NPS 2008a). The ecological characteristics of these unique water resources remain relatively unknown. Various wetlands such as bogs, fens, marshes, wet meadows, aquatic beds, and riparian forests and shrublands are found throughout the park. Although they occupy a very small portion of the landscape, wetlands often support a disproportionately high percentage of landscape biodiversity (Flinn et al. 2008; Van Dyke 2008; Apostol and Sinclair 2006).

North Cascades National Park Service Complex

NOCA has a diverse array of water resources including over 500 lakes and ponds scattered throughout the landscape. Many of these are tarns, which are remnants of the alpine glaciers. Many of the lakes and ponds are surrounded by marshes and wet meadows (NPS 2008b). As at MORA, wetlands such as bogs, fens, marshes, wet meadows, and riparian wetlands provide important habitat and support a significant number of species. An impressive complex of wetlands (one of the largest in NOCA) occurs along the lower reaches of the Chilliwack River (NPS 2008b).

Five major rivers drain the NOCA landscape. The Chilliwack River flow originates in the northwest portion of the park and flows north into British Columbia's Fraser River, which is the largest watershed along the west coast of North America (NPS 2008b). The Nooksack River also originates in the northwest portion of the park and carries drainage from the north flanks of Mount Baker and Mount Shuksan (the only part of this watershed within NOCA) westward to the Puget Sound. The Baker River drains the Picket Range and the southeast slopes of Mount Baker and then flows into the Skagit River which continues westward through the middle of NOCA before flowing into Puget Sound (NPS 2008b). The Skagit River watershed, which originates in British Columbia, is the largest drainage emptying into the Puget Sound (NPS 2008b). The reach above the confluence with the Baker River drains a significant portion of the northeastern and middle sections of NOCA. Three hydroelectric dams, Gorge, Diablo and Ross, were built in the early 20th century along the Skagit River (2008b). The Stehekin River drains the southeast section of NOCA and flows into Lake Chelan, a glacially carved, long, deep (third deepest in the United States) lake. Lake Chelan's outlet drains into the Columbia River (NPS 2008b). Hundreds of small streams and headwater wetlands, which received melt-water from seasonal snowpack and glaciers, feed into all of these rivers.

Olympic National Park

Olympic National Park supports over 3,000 miles of rivers and streams, hundreds of lakes, a variety of wetland types, and 73 miles of coastline along Pacific Ocean (NPS 2008c). These habitats support a rich diversity of aquatic flora and fauna ranging from unique bog plants, endemic amphibians, salmon, to a diversity of marine life (McNulty 2003). A few large lakes occur within or border OLYM boundaries including Lake Crescent, Lake Ozette, Lake Quinault, and Lake Cushman. These lakes were created when deep troughs were carved by glaciers and remnant ice and melt-water filled the lakes or were impounded behind terminal moraines. During more recent glacial activity (i.e. Fraser Glaciation), Lake Ozette is thought to have been an important refugium for many aquatic and wetland species (Buckingham et al. 1995). Massive landslides created an earthen dam across a portion of Lake Crescent and in the process created Lake Sutherland (Williams 2002). Lake Cushman resides in glacial trough and formed when the Skokomish River was impounded from a terminal moraine. Contemporary Lake Cushman is larger than the glacially-derived lake due to the construction of a dam near its mouth. Lake Quinault sits in the glacially carved valley of the Quinault River.

The Olympic Mountains form a central core within OLYM and each of the ten major rivers on the Olympic Peninsula radiate out from glaciers, seasonal snowfields, headwater wetlands and lakes. Generally, the rivers found in the western portion of the park are broad, glacially-carved U-shaped valleys with wide floodplains while those on the north, south, and east are often embedded in confined, narrow, steep-walled valleys (NPS 2008c). The Elwha River, the largest watershed within OLYM, originates deep in the Olympic Mountains and flows north into the Strait of Juan de Fuca. In the early 20th century, two dams, one of which occurs in OLYM (Glines Canyon Dam), were constructed along the Elwha River to supply power to local communities. However, the dams destroyed one of the richest runs of salmon outside of Alaska (ten different runs of anadromous fish). In 1992, the U.S. Congress passed the Elwha River Ecosystems and Fisheries Restoration Act which aims to restore the ecological integrity of the Elwha River watershed through partnerships of the National Park Service, the Lower Elwha Klallam Tribe, local communities, and the dam owners (NPS 2008c).

The Sol Duc River drains the northeastern corner of the park with headwater located along the northern flank of Bogachiel Peak and southern flank of Mount Appleton. The Bogachiel River drains the western flank of Bogachiel Peak flowing west toward the town of Forks then further to the Pacific Ocean. The Hoh and Queets rivers drain the flanks of Mount Olympus and then flow west toward the Pacific Ocean. In the southwest corner of OLYM, the Quinault River flows toward the Pacific Ocean upon travelling down a glaciated valley from its headwaters in near the central core of the Olympic Mountains. The Bogachiel, Hoh, Queets, and Quinault river drainages all support the so-called temperate rainforests which grow along the river terraces of these glaciated valleys (NPS 2008c; Franklin and Dyrness 1988). Only the upper most tip of the Wynoochee River that drains south into Chehalis River and Grays Harbor, occurs on OLYM. The Skokomish River drains the southern flanks of Mount Duckabush and western flanks of Mounts Skokomish and Henderson before flowing into Lake Cushman and then onto the Hood Canal. The Duckabush and Dosewallips rivers both drain the eastern side of the crest of the Olympic Mountains and flow eastward into the Hood Canal. The Dungeness River drains the northeastern portion of the park and flows just west of the town of Sequim before emptying into the eastern end of the Strait of Juan de Fuca.

Land Use and Settlement History

Historical and contemporary land use can have a significant effect on the vegetation patterns found in any particular location. Continual use of vegetation by native peoples can affect vegetation patterns by controlling succession through fire and altering species composition via selective use. Significant impacts from Euro-American settlers and contemporary human use include the introduction of non-native plants, mining, dam construction, fire suppression, and widespread logging. A brief description of historical and recent land use within or affecting each park is given below.

Mount Rainier National Park

Historical use of MORA by Native American tribes such as the Nisqually, Puyallup, Squaxin Island, Muckleshoot, Yakama, and Cowlitz included seasonal use (e.g. summer and fall) to hunt, gather berries, collect medicinal plants, and gather other useful resources (NPS 2008a). Archeological evidence does not suggest that native people established permanent residence in the current MORA rather use was associated with seasonal resource extraction (Catton 1996). Many of these tribes continue to use the park today for many of the same reasons as their ancestors. As early as 15,000 to 10,000 years B.P. (before present), when much of Mount Rainier was under permanent ice, many local people lived in the lowlands surrounding Mount Rainier (NPS 2008a). As the ice began to recede between 9,000 to 8,500 years B.P., many of the contemporary vegetation patterns began to develop. Elk, deer, mountain goats and sheep, pika, bear, ptarmigan, grouse, and huckleberries were all likely important food sources for native peoples, all of which tend to be most abundant in early seral forests, shrublands, or meadows (Burtchard 1998). The subalpine and alpine zones were likely the most common place to find these habitats in abundance. Archaeological evidence suggests that by 4,000 years B.P. (and possibly much earlier) native peoples were utilizing (e.g. hunting, gathering, collecting) resources found in the mid-upper elevation forests, wetlands, and meadows (NPS 2008a). Archeological studies at MORA didn't begin in earnest until the late 1990's and at present, only about 3.5% of MORA has been inventoried (NPS 2008a). To date, over 75 archaeological sites

and isolated artifacts have been documented throughout the park. These data do not provide much information about the full range of resources that were used nor do they indicate fluctuations or change in resource utilization through time (Burtchard 1998).

These studies have also revealed over 35 historic sites and isolated artifacts dating back to late 19th to early 20th century mining, recreation, and early park development. Such remains include old camp sites, trash, abandoned roadbeds, mine adits, and structural remains (NPS 2008a). Tent camps were established in this time period at Paradise to accommodate early tourists (Burtchard et al. 2008). During the mid- to late-19th century, the timber industry became established and grew with the development of the transcontinental railroad system providing a connection to eastern markets. These developments also resulted in the establishment and growth of urban centers in the region (Catton 1996). Much of MORA was set aside as a forest reserve in 1893 and thus was not subject to the intensity of timber harvest as other areas in the region (Catton 1996).

During the first four to five years after the park's creation, no more than 500 people visited the mountain each summer. Longmire and Paradise were the most popular destinations. Spray Park and Crater Lake (Mowich Lake) were also tourist destinations in the northwest portion of the park (Catton 1996). Visitor use climbed from 1,786 in 1906 to 34,814 in 1915 with most use concentrated in the southwest portion of the park (Catton 1996). Over 1.1 million tourists visited MORA in 2007 (http://www.nature.nps.gov/stats/).

North Cascades National Park Service Complex

The following discussion is adapted from NPS (2008b).

Historically, five Salishan-speaking tribes lived within NOCA. These tribes included the Nooksack, living along the Nooksack River; the Chilliwack, along the lower Chilliwack River and Chilliwack Lake; the Chelan, along the Stehekin River and Lake Chelan; the Upper Skagit, along the Skagit River below Newhalem Gorge; and the Lower Thompson, in British Columbia and along the Skagit River above the Newhalem Gorge. Native peoples used all zones of the mountains but permanently inhabited sites were limited to lowlands. Within NOCA, camps or villages have been discovered at the head of Lake Chelan, along the lower portions of the Chilliwack River, and along the Skagit River. The oldest site located is near the headwaters of the Skagit River, at Hozomeen, near the north end of what is now Ross Lake. Archaeological evidence suggests this site may have been occupied continuously or intermittently for over 8,000 years. Archaeologists are not certain whether the people living at Hozomeen are ancestors of contemporary tribes. Native peoples traveled into the mountains to trade and obtain local resources. Hunting camps, stone artifacts, and quarry sites have been found at high as 6,600 feet. Approximately 260 prehistoric sites have been identified, some dating older than 8,500 years. Mountain goats were a very important resource as they provided food and wool. Deer, elk, bear, marmots, and salmon were also important food sources. A trade network connecting people living east in the Columbia River Basin with those living west in the Puget Lowlands was established across many of the mountain passes within NOCA. For example, Cascade Pass was a crossroads for native peoples living in Lake Chelan and in the upper Skagit watershed. The Chilliwack and Lower Thompson native peoples may have used Whatcom Pass as a route across the northern portion of the North Cascades.

Commercial exploitation of the North Cascades began with fur trappers who were soon followed by miners, loggers, and builders. Fur traders were among the first Euro-Americans to explore the North Cascade region, although they are thought to have only explored lower reaches of the range. As settlement continued in the 19th century, fur trapping of beaver, bear, cougar, wolf, lynx, fisher, marten, and fox was conducted to supplement income and necessities. Exploration of the North Cascades by Euro-Americans began in the mid- to late 19th century. Although many expeditions occurred, most were restricted to major river valleys and mountain passes. In 1846, Washington Territory was opened to homesteading resulting in settlements being established along the Cascade, Skagit, and Stehekin river valleys. Most settlers made their living as shopkeepers and innkeepers for the trappers and miners who came to the area. Gold prospecting began along the Skagit River in the 1850s, and with the discovery of gold along Ruby Creek, a rush of miners descended into the valley. By 1880, miners began to focus on other minerals such as silver and lead, which were located at higher elevations. Claims were established near Cascade Pass in places such as Doubtful Lake, Boston and Horseshoe Basins, and Bridge Creek. Logging has not affected much of NOCA. However, once the natural logiam blocking along the lower Skagit River was cleared, logging operations began to work their way up the valley into the mountains. Some logging also occurred in the Stehekin Valley where small mills were established for local lumber use (e.g. apple boxes). For the most part, the absence of an adequate transportation system limited effort to expand logging over much of the NOCA landscape. Miners and settler built some roads, bridges, tunnels, and cabins throughout the area. In the early 20th century, two hydroelectric dams were built by Seattle City Light along the Skagit River: Diablo in 1930 and Ross Dam in 1940. The construction of these dams has not only impacted the aquatic environment of the river but also resulted in intensive logging in the valley. Over 81 unique and nationally recognized buildings and structures are found within the park. There are also remnants of at least 23 historic cultural landscapes within park boundaries. Vistor use is limited with less than 19,000 visitors in 2007 (http://www.nature.nps.gov/stats/).

Olympic National Park

The earliest known inhabitants of the Olympic Peninsula date back to about 13,000 years B.P. Modern native cultures became established about 4,000 to 6,000 years B.P. when contemporary vegetation patterns developed (Henderson 1989). Eight tribes are known to have been established on or utilized lands now within OLYM (NPS 2008c). These include the Hoh, Jamestown S'Klallam, Elwha Klallam, Makah, Port Gamble S'Klallam, Quileute, Quinault, and Skokomish (NPS 2008c). Archaeological studies in OLYM have been limited; however, available data suggests that native peoples likely used the high county much as those in NOCA or MORA did (McNulty 2003). The archaeological data clearly shows that native peoples developed a sophisticated culture around maritime resources. These peoples relied heavily on salmon, shell-fish, sea mammals as well as salal, huckleberries, camas, bracken fern, and salmonberry as food resources. Western redcedar was a very important resource for building materials, tools, baskets, clothing, etc. (NPS 2008c; Henderson et al. 1989). Many of these tribes still maintain their traditions. To date, about 650 archaeological sites have been documented in the park.

Euro-American settlement began in the mid-19th century. Settlement of the Olympic Peninsula occurred in the mid- to late-1800's (Henderson et al. 1989). Early settlements were mostly along the coast, near Hood Canal and present-day Port Townsend, Sequim, Port Angeles, and Neah

Bay (NPS 2008c). Some scattered homesteading occurred along some of the major river valleys, such as the Humes Ranch in OLYM (NPS 2008c). There are 130 historic structures in the park associated with early settler activity (NPS 2008c). Early logging on the Olympic Peninsula began in the northwest corner and near Grays Harbor (Henderson et al. 1989). The first sawmill was built at Port Discovery in 1858. Logging in the southern portion of the Peninsula began in the 1870's (Henderson et al. 1989). In 1885, Lieutenant J.P. O'Neil led an expedition to explore the northeastern Olympic Mountains which traveled the Dungeness drainage, Hurricane Ridge, and the Elwha River. The interior of the Olympic Mountains remained relatively unexplored by Euro-Americans until 1889 when the Press Expedition traversed up the Elwha drainage over the mountains and exited via the Quinault River (NPS 2008c). In 1890, Lieutenant O'Neil led another expedition exploring the South Fork and North Fork of the Skokomish River to O'Neil Pass. Thus, most of the interior of OLYM was relatively free of major human impacts. However, near the turn of the century, concern over excessive logging of the Olympic Peninsula was beginning to grow. The Olympic Forest Reserve was established in 1897 as a response to such concern. Twelve years later, President Theodore Roosevelt designated a portion of the reserve as Mount Olympus National Monument in order to provide further protection to the resident herd of Roosevelt elk (NPS 2008c). However, within a decade the monument size was cut in half due to pressure from the logging industry, opening much of the lowland forest to timber harvest (NPS 2008c). In 1938, President Franklin Roosevelt established Olympic National Park. In 1953, a strip of land along the coast was added to OLYM (NPS 2008c).

In 1935, 2,200 tourists visited Mount Olympus National Monument and in 1939 and that number grew to 404,125 in 1950, 2,289,200 in 1975, and 3,142,774 by 2005 (NPS 2008c). In 2005, 31,000 people spent time camping in the park's backcountry (NPS 2008c). OLYM has 16 developed campgrounds, 64 trailheads, 611 miles of hiking trail, 168 miles of road, and 457 buildings associated with the management and support of the park's resources (NPS 2008c). Visitor records for OLYM document over 3 million users in 2007, third most in the National Park system (http://www.nature.nps.gov/stats/).

Vegetation

The mild, wet climate of western Washington favors forest development. As such, the coniferous forests which dominate this region often attain a longevity and size which is unparalleled in most other forested regions of the world (Franklin and Dyrness 1988). In most mesic, temperate regions of the northern hemisphere conifers play a pioneer role in the landscape and, although they may be found in mature forests, are typically only dominant in early seral communities. However, in the Pacific Northwest, this pattern is reversed with deciduous, hardwood trees serving as the dominant early seral trees (Franklin and Dyrness 1988). This phenomenon is thought to be due to two factors: (1) historical biogeographic patterns and (2) the temporal distribution of precipitation (Franklin and Dyrness 1988). Historical climatic events may have selected the predominance of conifers from the Arcto-Tertiary forests of the Miocene (Brubaker 1991; Whitlock 1992; Franklin and Dyrness 1988). The contemporary climate of year-round mild temperatures along with a seasonal distribution of precipitation (e.g. wet winters and relatively dry summers) conveys a competitive advantage to conifers as they can continue growth through winter months as well as endure dry summer months (Franklin and Dyrness 1988). Fine-scale variation of environmental variables (e.g. soils, hydrology, aspect, geology, etc.) results in non-forested vegetation types such as wetlands, riparian areas, balds, prairies, oak

woodlands, etc. Disturbances such as fire, windthrow, lahars, avalanches, flooding, insect damage, disease, and human activity all strongly affect vegetation patterns throughout the region.

Vegetation patterns in the Pacific Northwest are often described using the Forest Zone concept, which is based on the climatically defined dominance of major tree species (Franklin and Dyrness 1988; Gavin et al. 2005). For this report, we describe broad vegetation patterns found within the three parks using mid-level units of the National Vegetation Classification (NVC), specifically the Macrogroup and Group units (FGDC 2008; Table 1), which occur at roughly similar scales to the Forest Zone concept. Macrogroups are defined by moderately broad sets of diagnostic plant species and growth forms that reflect biogeographic variation in composition and sub-continental to regional differences in mesoclimate, geology, substrates, hydrology, and disturbance regimes (FGDC 2008; Table 1). Groups are defined by relatively narrow sets of diagnostic plant species, broadly similar composition, and diagnostic growth forms that reflect biogeographic variation in mesoclimate, geology, substrates, hydrology, and disturbance regimes (FGDC 2008; Table 1). In the discussion below, Forest Groups that occupy most of the landscape (e.g. matrix forests) are described for each of the three parks. Thereafter, descriptions of the smaller scale vegetation types embedded within these matrix forests are provided within the context of Macrogroups and Groups. Specific patterns of distribution of the Macrogroups and Groups are then described for each park.

At low elevations along the coast, Sitka spruce (*Picea sitchensis*), western hemlock (*Tsuga* heterophylla), and western redcedar (Thuja plicata) dominate forests in areas with strong maritime influence where annual precipitation is generally greater than 100 inches and summer fog predominates (Henderson et al. 1989). These forests are classified as the North Pacific Hypermaritime Sitka Spruce Forest Group or the North Pacific Hypermaritime Western Redcedar -Western Hemlock Forest Group which, collectively, are synonymous with the Sitka Spruce Zone (Franklin and Dyrness 1988). The primary difference between these two Forest Groups is the dominance of Sitka spruce (over 10% cover) in the former and the high constancy of western redcedar in the Western Redcedar -Western Hemlock Forest Group. Sitka spruce is a dominant or codominant in the North Pacific Hypermaritime Sitka Spruce Forest Group with western hemlock, and western redcedar. Bigleaf maple (Acer macrophyllum), and rarely Pacific silver fir (Abies amabilis) or Douglas-fir (Pseudotsuga menziesii ssp. menziesii) may be present as forest canopy associates. Western hemlock and western redcedar are the dominant tree species in the North Pacific Hypermaritime Western Redcedar -Western Hemlock Forest Group. Red alder (Alnus rubra) dominates disturbed sites within both Forest Groups. Understory species composition in both Groups varies according to local site conditions but includes red huckleberry (Vaccinium parvifolium), Alaska huckleberry (Vaccinium alaskaense), salmonberry (Rubus spectabilis), salal (Gaultheria shallon), vine maple (Acer circinatum), sword fern (Polystichum munitum), lady-fern (Athyrium felix-femina), oxalis (Oxalis oregana), false lily-of-the-valley (Maianthemum dilatatum), Siberian miner's lettuce (Claytonia sibirica), and foamflower (Tiarella trifoliata) (Henderson et al. 1989). Along the Hoh, Quinault, Queets, and Bogachiel River valleys, old growth temperate "rain forests" are found on old alluvial terraces. Although species composition is similar to other forests in these Groups, the temperate "rainforests" are considered distinct by some researchers due to higher rainfall (140-167 inches), the immense size of the trees, the abundance of epiphytes, and herbivory associated with Roosevelt elk (Cervus canadensis roosevelti) (NPS 2008c).

The most extensive low elevation forest type in western Washington, the North Pacific Maritime Douglas-fir-Western Hemlock Forest Group is dominated by Douglas-fir, western hemlock and western redcedar. These forests are synonymous with the Western Hemlock Zone of Franklin and Dyrness (1988) and occur from southern British Columbia south through the Puget Trough, low lying areas on the Olympic Peninsula, and along the base of the west Cascades. Depending on latitude, elevation of this zone ranges from sea level to approximately 3300 ft. Western hemlock is the most shade tolerant of these species and thus is the characteristic dominant of mature forests. Douglas-fir is an early, long-lived seral species in this zone. However, due to the longevity of Douglas-fir, even old growth stands have a conspicuous amount of Douglas-fir present. Western redcedar is typically found on moist to wet sites. Common understory species include salal, oceanspray (Holodiscus discolor), Oregongrape (Mahonia nervosa), Pacific rhododendron (*Rhododendron macrophyllum*), sword fern, salmonberry, vine maple, various huckleberries (Vaccinium spp.), and oxalis (Oxalis oregana). Pacific Madrone (Arbutus menziesii) and Oregon white-oak (*Quercus garryana*) are found in dry sites throughout the area. Lodgepole or shoreline pine (Pinus contorta vars. contorta and latifolia) are found on stressful sites such as dry sites, lahars, and bogs. Hardwoods such as red alder and bigleaf maple are common on disturbed sites.

In the montane regions, the North Pacific Mesic Western Hemlock-Silver Fir Forest Group is the predominant forest type. These forests, equivalent to the Silver Fir Zone (Franklin and Dyrness 1988), occur on the western slopes and isolated upper eastern slopes of the Cascades and the Olympic Mountains, except for the northeastern portion. Elevation ranges from approximately 2000 feet to 4250 feet. Pacific silver fir, western hemlock, and Douglas-fir are major dominants of this zone. Noble fir (Abies procera), western redcedar and rarely western white pine can be dominant although these species usually occur as minor canopy associates. Near its upper elevation limit, mountain hemlock (*Tsuga mertensiana*) and Alaska yellow-cedar (*Cupressus nootkatensis*) may be present in this Group. Geography and site conditions (e.g. wet vs. dry) results in variable composition of these forests however huckleberries, false azalea (Menziesia ferruginea), salal, rhododendrons, pipsissewa (Chimaphila spp.), wintergreen (Pyrola spp.), bunchberry (Cornus unalaschkensis), queen's cup (Clintonia uniflora), twinflower (Linnaea borealis), beargrass (Xerophyllum tenax), brambles (Rubus lasiococcus, R. pedatus) and trailing yellow violet (Viola sempervirens) are common under a range of moisture conditions. Foamflower, rosy twistedstalk (Streptopus lanceolatus), vanilla leaf (Achlys triphylla), oak fern (Gymnocarpium dryopteris), inside-out flower (Vancouveria hexandra), and star flowered false Solomon's seal (Smilacina stellata) are common in mesic sites. In the Olympic Mountains, oxalis (Oxalis spp.) and deer fern (Blechnum spicant) are often common understory species. Douglas-fir and/or noble fir are typical early seral trees but give way to western hemlock and Pacific silver fir over centuries.

The North Pacific Mountain Hemlock-Silver Fir Forest and Tree Island Group, which ranges from approximately 4,250 to 6,050 feet, is the highest closed forest type in western Washington. The dominant trees in this group include mountain hemlock and silver fir. Those species are often early seral trees on moist sites while lodgepole pine and subalpine fir serve the seral role on drier sites. Site temperature, moisture, and snow accumulation influence species composition of these forests. Big huckleberry (*Vaccinium membranaceum*), oval-leaf blueberry (*V. ovalifolium*),

beargrass, one-sided wintergreen (*Orthilia secunda*), brambles (*Rubus lasiococcus*, *R. pedatus*), white rhododendron (*Rhododendron albiflorum*), false azalea, Sitka valerian (*Valeriana sitchensis*), trailing yellow violet, northwestern twayblade (*Listera caurina*), and avalanche lily (*Erythronium montanum*) are common understory species. Following fires, forest development can be slow due to harsh environmental conditions. Repeated burning of these areas leads to relatively permanent shrublands dominated by big huckleberry, mountain ash (*Sorbus* spp.), beargrass, and spiraea (*Spiraea* spp.).

At higher elevations, the North Pacific Mountain Hemlock-Silver Fir Forest and Tree Island Group and Northern Rocky Mountain Whitebark-Limber Pine Woodland Group typically appear as parklands with tree islands interspersed with extensive low shrublands and meadows. Mountain hemlock, Alaska yellow-cedar, subalpine fir, and Pacific silver fir dominate the tree islands in the North Pacific Mountain Hemlock-Silver Fir Forest and Tree Island Group. While subalpine fir, whitebark pine, subalpine larch (*Larix lyallii*), and the occasional Engelmann spruce are dominant and form woodlands and tree islands in Northern Rocky Mountain Whitebark-Limber Pine Woodland Group (limber pine (Pinus flexilis) does not occur in Washington but is part of this widespread floristic unit in the Rocky Mountains). Understory species in the tree islands of both Groups include many species found in adjacent meadows (i.e. the North Pacific Alpine-Subalpine Dwarf-shrubland and Heath and the Northern Rocky Mountain-Vancouverian Subalpine-Montane Mesic Herbaceous Meadow Groups) such as pink big huckleberry, mountain-heather (*Phyllodoce empetriformis*), white mountain-heather (Cassiope mertensiana), and blueleaf huckleberry (Vaccinium deliciosum). The extensive subalpine meadows are often dominated by subalpine lupine (*Lupinus arcticus* ssp. *subalpinus*), false hellebore (Veratrum viride), Sitka valerian, showy sedge (Carex spectabilis), alpine bistort (Polygonum bistortoides), partridgefoot (Luetkea pectinata), avalanche lily, and woolly pussytoes (Antennaria lanata) (Chappell et al. 2001). Another subalpine forest type within this group, occurs in the northeastern portion of OLYM and MORA and in NOCA. Subalpine fir (Abies lasiocarpa) is the dominant tree while Engelmann spruce (Picea engelmannii), and whitebark pine (Pinus albicaulis) can be codominants. Common understory species in these forests include rattlesnake plantain (Goodyera oblongifolia), smooth woodrush (Luzula glabrata), white rhododendron, false azalea (Menziesia ferruginea), mountain boxwood (Paxistima myrsinites), beargrass (Xerophyllum tenax), thimbleberry (Rubus parviflorus), and mountain ash (Sorbus spp.).

In contrast to the Rocky Mountains, the alpine zone in the Cascades and Olympic Mountains is limited due to a narrow belt between treeline and permanent snow/ice, as well as the steep, rugged terrain resulting in an abundance of bare rock and talus. Extreme cold, windy sites with moderate to deep snowpack form alpine environments (Chappell et al. 2001). Alpine plants have adapted to constant wind, intense solar radiation, drought, and infertile and poorly developed soils (Biek 2000). The distribution of alpine vegetation types is controlled by length of the growing season, slope, and aspect (Edwards 1980). Vegetation consists of krummholz stands of tree species which also occur in the subalpine and a mosaic of dwarf-shrublands, turf, fell-fields, and sparsely vegetated snowbed communities. This collectively comprises the North Pacific Alpine Herbaceous Meadow and the North Pacific Alpine-Subalpine Dwarf-shrubland Groups. Characteristic species include white mountain-heather, pink mountain-heather, green mountain-heather (*Phyllodoce glanduliflora*), partridgefoot, Tolmie's saxifrage (*Saxifraga tolmiei*),

crowberry (*Empetrum nigrum*), common juniper (*Juniperus communis*), evergreen kinnikinnick (*Arctostaphylos uva-ursi*), shrubby cinquefoil (*Pentaphylloides floribunda*), willows (*Salix cascadensis*, *S. reticulata* ssp. *nivalis*), alpine fescue (*Festuca brachyphylla*), sedges (*Carex spectabilis*, *C. nigricans*, *C. breweri*, *C. capitata*, *C. nardina*, *C. phaeocephala*, *C. pseudoscirpoidea*), spreading phlox (*Phlox diffusa*), Lobb's lupine (*Lupinus sellulus* var. *lobbii*), mountain avens (*Dryas octopetala*), Piper's woodrush (*Luzula piperi*), and louseworts (*Pedicularis contorta*, *P. ornithorhyncha*) (Chappell et al. 2001).

Throughout each of the three parks, smaller scale vegetation types are found within the Forest Groups described above. For example, bigleaf maple, Sitka spruce, black cottonwood (Populus balsamiferia ssp. trichocarpa), red alder, Oregon ash (Fraxinus latifolia), salmonberry, devil's club (Oplopanax horridus) and a variety of other shrubs and herbaceous species are characteristic of the North Pacific Lowland Riparian Forest and Woodland Group (Chappell 1999). Riparian groups are in typically well-drained areas with overbank flooding, groundwater discharge or high water tables associated with flowing water. The North Pacific Lowland-Montane Riparian and Wet Slope Shrubland Group occurs at higher elevations and is dominated by mountain alder (Alnus incana ssp. tenuifolia), Sitka alder (A. viridis ssp. sinuata), Booth's willow (Salix boothii), undergreen willow (S. commutata), Sierran willow (S. eastwoodiae), and blueberries (Vaccinium uliginosum or V. deliciosum). Red alder and western redcedar, along with understory species such as deer fern (Blechnum spicant), skunk cabbage (Lysichiton americanum), slough sedge (Carex obnupta), salmonberry, and water-parsley (Oenanthe sarmentosa) dominate the North Pacific Hardwood-Conifer Swamp Group which mostly occurs at low elevations. The North Pacific Lowland Bog and Fen Group is found at low elevations in poorly drained river valleys, along lakes and in depressions throughout western Washington where various species of sedges (Carex spp.), ericaceous shrubs (Kalmia microphylla, Ledum groenlandicum, Vaccinium oxycoccos, etc.), and Sphagnum moss predominate (Kulzer et al. 2001). Shore pine (*Pinus contorta* var. *contorta*), sweet gale (*Myrica gale*), and hardhack (Spiraea douglasii) are occasionally found in these peatlands. The North Pacific Montane Fen Group also occurs in the subalpine zone. These peatlands are dominated by variety of species including bog-laurel (Kalmia microphylla), sedges (e.g. Carex aquatilis, C. utriculata, C. echinata ssp. echinata), Thurber's bentgrass (Agrostis thurberiana), cottongrass (Eriophorum spp.), tufted clubrush (*Trichophorum cespitosum*), marsh violet (*Viola palustris*), northern star flower (Trientalis arctica), Oregon saxifrage (Saxifraga oregana), elephant head (Pedicularis groenlandica) as well as Sphagnum and brown mosses (Chappell et al. 2001). The Temperate Pacific Freshwater Emergent Marsh Group is abundant throughout western Washington and is comprised of sedges (Carex spp.), bulrushes (Scirpus and Schoenoplectus spp.), cattail (Typha latifolia), spike-rushes (Eleocharis spp.), rushes (Juncus spp.), burreeds (Sparganium spp.), pondweeds (Potamogeton spp.), various grasses, and aquatic plants (Chappell et al. 2001). In the subalpine, the Temperate Pacific Subalpine-Montane Wet Meadow Group is interspersed in throughout the subalpine parklands and dominated by marsh marigold (Caltha leptosepala), tufted hairgrass (Deschampsia caespitosa), bluejoint reedgrass (Calamagrostis canadensis), black sedge (Carex nigricans), Holm's Rocky Mountain sedge (C. scopulorum), Sitka sedge (C. aquatilis var. dives), and Northwest territory sedge (C. utriculata) (Chappell et al. 2001).

Small patch upland vegetation types include the North Pacific Hypermaritime Shrub and Herbaceous Headland Group located along the outer coast in OLYM subject to strong winds and

salt spray that result in a stressful environment supporting small grasslands in a mosaic with stunted trees and shrublands. Shrubs such as salal, crowberry (Empetrum nigrum), evergreen huckleberry (Vaccinium ovatum) are common along with grasses such as (Calamagrostis nutkaensis) and Sitka brome (Bromus sitchensis) (Rust 1992; Chappell et al. 2001). The North Pacific Herbaceous Bald and Bluff Group appear in the lowland up into the montane. This Group consists of distinct, small patches of non-forested areas within the forest matrix which occur on steep slopes with relatively shallow soils overlaying a restrictive layer of bedrock (Chappell 2006). Balds are dominated by herbaceous vegetation, dwarf-shrubs, and/or mosses and lichens and are often fringed by Vancouverian Dry Douglas-fir-(Madrone) Forest and Woodland Group (Chappell 2006). Talus or scree slopes (e.g. North Pacific Montane Massive Bedrock, Cliff, and Talus Group) have variable composition but vine maple, oceanspray, trailing snowberry (Symphoricarpos hesperius), parsley fern (Cryptogramma crispa), beaked hazelnut (Corylus cornuta var. californica), and redstem ceanothus (Ceanothus sanguineus) are common associates. Snow creep and/or avalanches maintain shrublands dominated by Sitka alder (Alnus sinuata). Due to frequent avalanches these shrublands are fairly stable with Alaska yellow-cedar being the only tree to survive in these areas. Forbs are often abundant in these shrublands due to high moisture levels.

Mount Rainier National Park

Spatial and temporal climatic variation, volcanism, glacier activity, elevation changes (gradient of over 12,000 feet), large-scale disturbances (fire, windthrow, insects, avalanches, etc.) and various geologic substrates and soils types have resulted in a rich diversity of vegetation across relatively short distances at MORA (NPS 2008a). This diversity is expressed both in the number of plant species (over 890 vascular and 260 non-vascular plant and fungi species) as well as in the diversity of plant associations. More than 100 exotic plant species also occur in MORA, mostly along transportation corridors, near trails and campsites, and along riparian corridors (NPS 2008a).

Approximately 58 percent of the park is forested. Temperature, moisture (including snowfall), and disturbance regimes are strong determinants of the type of forest found in any given site (Franklin et al. 1988). The age of individual forest stands varies according to the time since the last major disturbance. Stands less than 100 years old occur on moraines left by receding glaciers, mudflows, or burned areas while 1,000 year old-growth stands occur in areas protected from disturbances in the Ohanapecosh, Cowlitz, Nisqually, and Carbon River drainages (Franklin et al. 1988). Summer moisture regimes appear to have a strong influence on the patterns of forest types in the lowlands (Franklin et al. 1988).

The North Pacific Maritime Douglas-fir-Western Hemlock Forest Group occurs from the park's boundary at 1,700 feet to approximately 3,000 feet in elevation and is best developed in the major river valleys (Biek 2000). One of the few examples of an inland temperate rainforest (similar to those found in the North Pacific Hypermaritime Sitka Spruce Forest Group) is found in the northwest portion of the park in the Carbon River drainage (Biek 2000). The North Pacific Mesic Western Hemlock-Silver Fir Forest Group, the characteristic forest type for MORA, is found up to about 4,700 feet. These forests are found on level to steep topography. Pacific silver fir, Alaska yellow-cedar, western white pine, and noble fir are characteristic species. These forests have a closed canopy but shorter and fewer understory shrubs and less cover of

herbaceous species giving it a more open appearance than the North Pacific Maritime Douglas-fir-Western Hemlock Forest Group forests (Biek 2000). The North Pacific Mountain Hemlock-Silver Fir Forest and Tree Island Group occur in the subalpine and extends up to about 7,000 feet with closed forests giving way to subalpine parklands (mosaic of tree islands and meadows) usually between 4,500 feet to 5,000 feet and subalpine parklands transition into alpine environment around 7,000 feet (NPS 2008a). The depth and duration of snowpack strongly influences forest patterns in the North Pacific Mesic Western Hemlock-Silver Fir Forest and North Pacific Mountain Hemlock-Silver Fir Forest and Tree Island Groups (Franklin et al. 1988).

The subalpine parklands extend up to about 7,000 feet and occupy about 23 percent of the park. The meadows found in MORA's subalpine parklands have been clustered into two Groups and, as with the forest communities, are associated with the depth and duration of snowpack: (1) North Pacific Alpine-Subalpine Dwarf-shrubland and Heath Group, which are dominated by ericaceous shrubs such as mountain heather (*Phyllodoce* or *Cassiope*) or huckleberry (*Vaccinium* spp.); and (2) Northern Rocky Mountain-Vancouverian Subalpine-Montane Mesic Herbaceous Meadow Group which includes a) lush herbaceous meadows dominated by tall perennials such as Sitka valerian, subalpine lupine, showy sedge, and green hellebore (*Veratrum viride*), b) low herbaceous meadows dominated by fan-leaved cinquefoil (*Potentilla flabellifolia*), pussytoes (*Antennaria* spp.), and black sedge (*Carex nigricans*), and c) dry grasslands dominated by green fescue (*Festuca viridula*) and subalpine lupine located on well-drained sites more common on the east side of the park (Henderson 1974; Franklin et al. 1988). The Temperate Pacific Subalpine-Montane Wet Meadow Group dominated by sedges along with alpine aster (*Oreostemma alpigenum*) and pussytoes also occurs in these parklands.

The alpine environment extends from the upper limit of the subalpine parklands to Mount Rainier's summit. Approximately 50 percent of the alpine is covered by permanent snow and ice and glacier-modified bedrock (North Pacific Alpine and Subalpine Bedrock and Scree) while the remaining area is dominated by sparse to open alpine vegetation of the North Pacific Alpine-Subalpine Dwarf-shrubland and Heath and the North Pacific Alpine Herbaceous Meadow Groups. This vegetation includes: (1) fell-fields which consist of small rocks on gentle slopes. The rocks provide protected niches where sedges, golden fleabane (*Erigeron aureus*), Lobb's lupine, spreading phlox, mountain avens, Piper's woodrush, penstemons (*Penstemon* spp.), and louseworts; (2) snowbeds have the shortest growing season and some may not be snow-free every year. Tolmie's saxifrage, Shasta buckwheat (*Eriogonum pyrolifolium*) or Piper's woodrush are typical dominate species of snowbeds; and (3) dwarf-heath shrublands are the oldest known plant communities in MORA with some thought to have persisted for up to 10,000 years. Pink mountain-heather, green mountain-heather, white mountain-heather, and black crowberry are common dominant species (Chappell et al. 2001; Edwards 1980). Green fescue also occurs as fairly extensive grasslands above treeline in the northeastern part of the park.

North Cascades National Park Service Complex

Complex geology, climate, topography, aspect, and elevation have resulted in NOCA supporting the highest diversity of vascular plants (over 1,630 species) found in any of the National Parks in the United States (NPS 2008b). Those abiotic factors also result in a variety of vegetation types. Temperature and moisture regimes have a strong influence on the distribution of forest types in NOCA. The width of the Cascade Range within NOCA creates rainshadow effects observed

even west of the Cascade Crest. Thus, in addition to species typically found in the forests of western Washington, many plant species and communities more characteristic of the mountains of eastern Washington are found within the park (Agee and Kertis 1987). The Upper Skagit-Ross Lake area within the park is well known for the convergence of coastal species with those more typical of the interior mountains (Franklin and Dyrness 1988). Slopes on the west side of Ross Lake exhibit a vegetation sequence characteristic of western Washington while slopes on the east side of Ross Lake and in the upper Lake Chelan area show forest patterns typical of the drier interior forest types. Groups with strong Rocky Mountain floristic components typically found at NOCA include the Northern Rocky Mountain Douglas-fir-Pine Forest, Northern Rocky Mountain Ponderosa Pine Woodland, East Cascades Mesic Grand fir-Douglas-fir Forest, Northern Rocky Mountain Whitebark-Limber Pine Woodland, Rocky Mountain Subalpine Dry-Mesic Spruce-Fir Forest and Woodland, and Rocky Mountain Subalpine Mesic-Wet Spruce-Fir Forest and Woodland Groups (Agee and Kertis 1987; Franklin and Dyrness 1988).

Matrix Forest Groups in NOCA are presented in the order encountered along a west to east trajectory (unless otherwise noted, this summary is adapted from Douglas (1969)). The North Pacific Maritime Douglas-fir-Western Hemlock Forest Group is found in lowlands up to about 2,500 feet and even higher on south-facing dry slopes. In addition to the species previously described for this Group, paper birch (Betula papyrifera), a species not found south of Everett, Washington, appears throughout these forests in NOCA (Arno and Hammerly 2007). Impressive old-growth western redcedar stands are found on alluvial terraces of Big Beaver, Little Beaver, Baker, and Chilliwack Creeks in the park (Miller and Miller 1970). The North Pacific Mesic Western Hemlock-Silver Fir Forest Group occurs in the park between 2,500 to 4,200 feet on north slopes and up to about 5,200 feet on south slopes. In valleys with substantial cold-air drainage, these forests can extend below 2,500 feet. As at Mount Rainier National Park, this Forest Group is the most extensive forest type in NOCA and is even found east of the Cascade crest in the Upper Lake Chelan area. The North Pacific Mountain Hemlock-Silver Fir Forest and Tree Island Forest Group is found above 4,200 feet on north slopes and above 5,200 feet on south slopes. However, the upper limit is variable due to very steep topography and microclimates. For example, the highest noted treeline noted in NOCA is at approximately 6,500 feet. These forests are also found on both sides of the Cascade crest in the Lake Chelan area.

The North Pacific Alpine-Subalpine Dwarf-shrubland and Heath, Northern Rocky Mountain-Vancouverian Subalpine-Montane Mesic Herbaceous Meadow, and Temperate Pacific Subalpine-Montane Wet Meadow Groups intermingle with the North Pacific Mountain Hemlock-Silver Fir Forest and Tree Island and Northern Rocky Mountain Whitebark-Limber Pine Woodland Groups to form the characteristic subalpine parklands and meadows. The alpine in NOCA is extremely fragmented and most occurrences are small due to very steep topography. In addition to krummholz, heath shrublands (*Phyllodoce* ssp. and *Cassiope mertensiana*) associated with the North Pacific Alpine-Subalpine Dwarf-shrubland and Heath and North Pacific Alpine Herbaceous Meadow Groups are a major component of the alpine in NOCA. East of the high ridges in NOCA, forests typical of eastern Washington begin to dominate the landscape. The Northern Rocky Mountain Whitebark-Limber Pine Woodland Group is the first to appear (at high elevation) heading east. In the upper Lake Chelan area, North Pacific Mesic Western Hemlock-Silver Fir and Northern Rocky Mountain Douglas-fir-Pine Forest Groups occur below subalpine forests. The Northern Rocky Mountain Douglas-fir-Pine Forest Group,

found in the Ross Lake and Lake Chelan areas of NOCA, occurs along valley, stream terraces, and lower south slopes. Ponderosa pine (*Pinus ponderosa*) and Douglas-fir are early seral species. Douglas-fir dominates south slopes while grand fir dominates mesic areas. In north facing drainages, Douglas-fir, grand fir, western hemlock, western redcedar, and western white pine can co-occur as dominants.

Olympic National Park

As with the other parks, climate, topography, and elevation strongly influence vegetation patterns at OLYM. There are 1,452 species, subspecies, and varieties of plant species found on the Olympic Peninsula and the region supports 28% of the rare species tracked by the Washington Natural Heritage Program (Buckingham et al. 1995). The steep environmental gradients found in the area also support a diverse array of vegetation types.

The low elevation coastal portion of the park is dominated by the North Pacific Hypermaritime Sitka Spruce and North Pacific Hypermaritime Western Redcedar -Western Hemlock Forest Groups, both of which are found along the narrow coastal plain between the Pacific Ocean and Olympic Mountains. These forests are found below 500 feet along the coastal strip of OLYM and can reach up to 2000 feet in the river valleys on the western slope of the Olympic Mountains. These forest Groups occupy approximately 10% of OLYM (UNEP 2008). The mild climate in these areas results in extremely lush forests with dense, exuberant understory growth and an abundance of bryophytes (NPS 2008c). The North Pacific Lowland Bog and Fen Group is occasionally found along the coastal plain. The North Pacific Hypermaritime Shrub and Herbaceous Headland Group is found along the coast and is dominated by various shrubs, herbaceous species and scattered krummholz-like Sitka spruce trees (and the occasional Douglas-fir, western hemlock, or red alder) (Chappell et al. 2001).

The North Pacific Maritime Douglas-fir-Western Hemlock Forest Group occurs at the base of the Olympic Mountains in very wet to dry habitats and occupy about 10% of OLYM (UNEP 2008; Henderson et al. 1989). These forests have a much broader elevation range on the drier, east-side of the Peninsula where they can reach up to about 4,000 feet while in wetter areas they typically only reach up to about 2,000 feet and thus have a much narrower range (Henderson et al. 1989). On the western and wetter side of the Olympic Mountains, the North Pacific Maritime Douglas-fir-Western Hemlock Forest Group differs from other areas in western Washington by the predominance of western redcedar and western hemlock, widely scattered silver fir, and relatively low abundance of Douglas-fir. The North Pacific Mesic Western Hemlock-Silver Fir Forest Group is the major forest type, approximately 50% of the park and occurs between 2,000 and 4,000 feet. A few very old Douglas-fir trees (700+ years) are found within these forests in the wetter portion of the park and indicate an earlier and drier climate (McNulty 2003). The North Pacific Mesic Western Hemlock-Silver Fir Forest Group is absent from dry, south-facing slopes in the northeastern portion of the park, generally between 1,805 to 3,609 feet, and instead are dominated by forests similar to the Vancouverian Dry Douglas-fir-(Madrone) Forest and Woodland Group (Henderson et al. 1989; UNEP 2008). These forests are dominated by Douglasfir that can contain small amounts of grand fir, lodgepole pine, seaside juniper (Juniperus maritima), or Pacific madrone (Henderson et al. 1989).

Except for the northeastern portion of OLYM, the subalpine, areas between 4,000 to about 6,000 feet, is dominated by the North Pacific Mountain Hemlock-Silver Fir Forest and Tree Island Forest Group. This forest Group occupies 20% of the park and includes the subalpine parklands (Henderson et al. 1989; UNEP 2008). As in the other two parks, the North Pacific Alpine-Subalpine Dwarf-shrubland and Heath, Northern Rocky Mountain-Vancouverian Subalpine-Montane Mesic Herbaceous Meadow, and Temperate Pacific Subalpine-Montane Wet Meadow Groups intermingle with the North Pacific Mountain Hemlock-Silver Fir Forest and Tree Island Group to form characteristic subalpine parklands and meadows. A notable spruce-fir forest type occupies the northeastern portion of the subalpine that is dominated by subalpine fir and/or lodgepole pine along with occasional whitebark pine and mountain hemlock (Henderson et al. 1989).

The North American Alpine Ice Field, North Pacific Alpine and Subalpine Bedrock and Scree, and North Pacific Alpine-Subalpine Dwarf-shrubland and Heath, and North Pacific Alpine Herbaceous Meadow Groups dominate the alpine zone which occupies approximately 10% of the park and is generally found above 6,000 feet. The vegetated portion of alpine is generally found below 7,382 feet where steep topography and permanent ice limit vegetation growth. Alpine vegetation is characterized by heath dwarf-shrublands, mat-forming, low shrubs dominated by spreading phlox, and turfs dominated by showy and black sedges.

Previous Vegetation Studies

Mount Rainier National Park

Botanical exploration over the past two centuries in MORA provide many citations from the late 1800's and early 1900's (NPS 2008a). Although Archibald Menzies, John Scouler, and David Douglas had conducted floristic surveys of western Washington the in late 18th and early 19th centuries, it was not until 1833 that William Tolmie collected plants within MORA boundaries (Biek 2000). Charles Pickering and W.D. Brackenridge, botanists associated with the Wilkes Expedition, botanized extensively up the White River to Naches Pass providing the first compilation of plants for the region near MORA (Biek 2000). Charles Piper extensively studied the flora in the region of Mount Rainier in the late 1880's. Piper published his findings in a series of articles titled "The Flora of Mount Rainier" in *The Mazama* in 1902 in which he documented 295 species (Biek 2000). In 1929, the National Park Service initiated a systematic effort to build an herbarium for the park. George Jones published the first comprehensive flora of the park, *The Flowering Plants and Ferns of Mount Rainier*, in 1938 which included 729 species. In 1983, Peter Dunwiddie listed 804 species as occurring in the park in his dissertation entitled "Holocene Forest Dynamics on Mount Rainier, Washington" (Biek 2000). The latest compilation occurs in *Flora of Mount Rainier National Park*, by David Biek (2000).

In response to concerns of human impacts to subalpine meadows, Frank Brockman conducted an ecological study of the meadows in 1959-1960 to determine the effects of foot traffic on the subalpine vegetation communities (NPS 2008a). Additional research by Hamman (1972), Henderson (1974), Edwards (1980), and NPS Science Advisor, Regina Rochefort (Rochefort and Peterson 1996) has contributed much knowledge about the ecology of subalpine and alpine meadows.

In 1975 through 1980, Franklin et al. (1988) classified and mapped Mount Rainier's forests. This research defined fourteen types of mature forests and five early seral forest types. This work has had a significant influence on management decisions within the park, especially those associated with fire management and development planning (NPS 2008a). Some other ecological studies include Hemstrom and Franklin's (1982) study of fire and disturbance ecology of the park's forests, Frehner's (1957) work on soil development and vegetation succession on the Kautz Creek mudflow, Dunwiddie's (1983) research on Holocene forest dynamics, and Cushman's (1981) study on the influence of recurrent avalanches on vegetation patterns (Biek 2000). Vegetation classification research on lands adjacent to MORA also provide insight into vegetation patterns in the park (del Moral and Long 1977; Henderson et al. 1992). The citations above only provide a brief overview of the research which has been and continues to be conducted at MORA.

North Cascades National Park Service Complex

In 1892, E.R. Lake and W.R. Hull collected plants in the upper end of Lake Chelan and at Cascades Pass (Alverson and Arnett 1986). Kirk Whited made collections near Stehekin in 1901 and David Griffith and J.R. Cotton collected around Stehekin in 1908. Harold St. John botanized and collected in the Lake Chelan area in 1924. George Ward made extensive collections in the early 1940 for his *Flora of Chelan County* (Alverson and Arnett 1986). Dorothy and Ralph Naas have made extensive collections throughout the North Cascades. Alverson and Arnett (1986) documented 665 species in the Lake Chelan-Sawtooth Ridge area. In 2002, NOCA contracted with the University of Washington Herbarium to organize a series of plant collecting trips to generate vouchers of the park's flora. From 2002-2005, 465 taxa were collected at NOCA and nearly 23% of these taxa represent new voucher records for the NOCA herbarium (NPS 2008b).

Vegetation studies in the region begin in 1962 when the U.S. Forest Service established permanent monitoring plots in the Lake Chelan-Sawtooth Ridge area to determine grazing effects on subalpine vegetation (Alverson and Arnett 1986). Franklin and Trappe (1963) provided a general description of vegetation patterns in the North Cascade range. Douglas (1969) conducted a vegetation survey of NOCA and provided a preliminary vegetation classification of the park. In the early 1970's, Douglas continued extensive ecological study of NOCA vegetation communities, including a survey of potential natural areas (Douglas 1971) and classification and ecological investigations of subalpine-alpine communities (Douglas 1972; Douglas and Bliss 1977). High elevation vegetation communities of the North Cascades range were also studied by del Moral and colleagues, who conducted work in the Alpine Lake region (del Moral et al. 1976) and Enchantment Lake Basin (del Moral 1979). Ron Taylor and George Douglas studied the natural history and vegetation ecology of Chowder Ridge near Mount Baker (Taylor and Douglas 1977) and Alverson and Arnett (1986) described vegetation types in the Lake Chelan-Sawtooth Ridge area. Agee and Kertis (1987) published a summary of the vegetation studies which accompanied the development of a cover type map for the park, in which they identify 18 cover types. Two U.S. Forest Service plant association field guides include portions of the North Cascade region have contributed much knowledge about the vegetation types within and near NOCA. These include the plant association field guide for the Mount Baker-Snoqualmie National Forest (Henderson et al. 1992) and the guide for the Wenatchee National Forest (Lillybridge et al. 1995). Grizzly Bear Habitat analysis work involved vegetation analysis and classification plant communities (Almack et al. 1993). A recent ecological study of montane

wetlands in the North Cascades has also advanced vegetation ecology in the region (Risyold and Fonda 2001).

Olympic National Park

Archibald Menzies was the first botanist to explore the Olympic Peninsula in 1792. David Douglas apparently botanized in the eastern portion of the peninsula near the Hood Canal in the early 1800's and John Scouler collected from the "Straits of Juan de Fuca" in the 1820's and thus likely was in the northern part of the peninsula (Henderson et al. 1989). Charles Pickering and W.D. Brackenridge, botanists associated with the Wilkes expedition of 1841, collected in the northeastern portion of the peninsula. Louis Henderson, a botanist associated with the O'Neil expedition, was the first botanist to explore the interior of the Olympic Mountains. J.B. Flett botanized the Olympic Mountains in 1895 and L.H. Lamb collected in the southwest portion of the Olympic Peninsula in 1897 (Henderson et al. 1989). C.V. Piper surveyed the Olympic Mountains in 1890 and 1895 and included his and others collections in his 1906 "Flora of Washington." George Neville Jones extensively explored the Olympic Peninsula from 1923-1935 and based on that work as well as the work of earlier botanists described the flora for the Olympic Peninsula (Henderson et al. 1989). Buckingham et al. (1995) have provided the most recent checklist of vascular plants occurring on the Olympic Peninsula.

The first ecological description of vegetation in the Olympic Peninsula was published in George Jones' 1936 manuscript where he used the Merriam Life Zone concept to describe vegetation patterns in the region. Fonda and Bliss (1969) developed the first plant association classification for forests of the Olympic Mountains and Kuramoto and Bliss (1970) did the same for subalpine meadows. Fonda (1974) described forest succession on river terraces in OLYM. Kratz (1975) conducted a classified vegetation types within the Sitka Spruce Zone of OLYM. Belsky and del Moral (1982) studied the ecology of subalpine-alpine meadows. Henderson et al. (1989) published a classification of the forested plant associations of the Olympic National Forest. More recently, Bigley and Hull (1995) developed a forested plant association classification and Chappell (1999) initiated a classification of low-elevation riparian vegetation for the Olympic Experimental State Forest.

Methods

The methods used in this project were designed to build upon existing vegetation classification efforts in the Pacific Northwest. The project incorporates and re-evaluates 1) legacy data from previous vegetation studies and 2) new data collected by National Park Service mapping crews. Collection of new data in the parks was designed to fill known gaps in the existing classification, to document the occurrence of known associations, and to identify previously unrecognized associations. This iterative process first required that a preliminary classification and key for use by the field crews be synthesized from previous classification efforts. The subsequent collection of new data was used to update and refine the next version of the classification. An initial classification was compiled in 2005, intermediate classifications in 2006 and 2007, followed by the final classification in 2008.

Preliminary Classification

The 2005 preliminary classification was developed using three major sources of plant associations; 1) the 2005 coastal forests correlation project (CFCP Meidinger et al. 2005), 2) the 2005 version of the NVC/IVC International Vegetation Classification (FDGC 2008, NatureServe 2005) and 3) the WNHP state vegetation classification.

The 2005 preliminary classification included all plant associations recognized by NatureServe (2005), as well as new associations and future revisions to NatureServe (2005) from the coastal forests correlation project (CFCP) (Meidinger et al. 2005). The CFCP quantitatively compared plant associations from southeastern Alaska south to southwestern Oregon. Data sets of previously defined plant associations were collected into a single database and then compared with similarity indices and constancy/cover tables. A group of ecologists with regional expertise in vegetation classification reviewed the analyses and made proposals for combining and naming plant associations on this rangewide scale. C. Chappell, one of the primary authors of the CFCP, wrote short summary descriptions tailored to the three parks for associations which did not already have a summary written by NatureServe. He used CFCP vegetation tables and associated regional publications for environmental information. He edited existing NatureServe global summary descriptions of IVC/NVC plant associations to better reflect how they occur in the three parks.

The WNHP state vegetation classification includes citations of all plant associations described in Washington. The list of plant associations described in the state by all authors for associations was reviewed for potential associations likely to occur in one or more of the three parks and not already on the list of IVC/NVC and CFCP Correlation associations. Those associations recognized within the state, but not globally by NatureServe were included in the preliminary classification for the three parks. In addition, some NatureServe shrubland and herbaceous vegetation types were revised based on a recent correlation of all associations described in publications and reports for the subalpine and alpine zones in Washington.

Using the approach described above, preliminary summary descriptions were written for 192 upland types (including all physiognomic classes) and forested wetland types. Additionally, a list

of the names of 50 shrub and herbaceous wetland associations likely in the parks was compiled. A preliminary key to upland associations was prepared to support field sampling.

Field Methods

Field Sampling Approach

With only two field seasons allocated to classification sampling, a targeted approach to sampling was developed that directed NPS field crews to sample in areas or vegetation types known to be gaps in the legacy data and previous vegetation classification work in the region. In 2005, Chris Chappell with the WNHP provided the following prioritization scheme to direct the field sampling. High priority areas included; shrublands, particularly avalanche chutes; Douglas-fir forests west of the Cascade Crest with no or little western hemlock or western redcedar (less than 10% cover); forests and woodlands in the Ross Lake area of NOCA dominated or co-dominated by Douglas-fir, ponderosa pine, and/or lodgepole pine; subalpine parkland tree islands/stringers west of the Cascade Crest; western redcedar-dominated upland stands with little to no western hemlock; herbaceous or dwarf-shrub "balds" west of the Cascade Crest, and dry grasslands below the subalpine zone. Medium priority areas included riparian forests (riverine floodplain or terraces), non-forested wetlands, especially middle elevations, ponderosa pine- dominated stands and bigleaf maple stands. The descriptions included in the preliminary classification also indicated when a provisional or temporary association needed more data for clarification.

Plot Data Collection

The plot data collection methods combined guidance from the NPS Vegetation Mapping Program Field Methods for Vegetation Mapping (TNC and ESRI 1994a), WNHP data collection protocols, and methods used by the USFS (Henderson and Lesher, 2003).

The basic plot survey method instructed crews to establish a fixed radius plot, the size of which scaled depending on vegetation structure. Forest plots had an area of 400 m2, shrub plots were 100 m2 and dwarf shrub, herbaceous and sparse plots were 50 m2. Within the plot, the crews recorded a suite of environmental variables including aspect, slope, elevation, landform, microposition, macroposition and topographic moisture, which is a moisture availability index that relates slope configuration (e.g. convex or concave) at the plot scale to relative slope position at the mountain scale (Henderson and Lesher 2003). When appropriate, the crews noted wetland type and hydrologic regime. A shallow hole was dug for soil characterization and texture and color was recorded by horizon.

Vegetation characterization included selecting physiognomic class, leaf type and phenology and recording the cover of dominant species by vertical layers (strata). The crews recorded an association name when possible. For undescribed types the field crew assigned a preliminary name. They also recorded feedback on the adequacy of field key and descriptions. The core of the classification plot data is the ocular species list. The crews recorded crown cover (in classes) by species for all species seen in the plot. Cover of a bryophyte species was recorded when cover was greater than 1%. Bryophytes growing on logs were excluded from cover estimates. Additional details on sampling methodology can be found in the Guide for Field Sampling (Appendix G). Examples of the field forms used in sampling are included in Appendix G.

Legacy Data

NPS staff initially acquired legacy plot data and summarized their metadata. The WNHP staff evaluated the summarized metadata to determine if the plot data were appropriate for vegetation classification. The criteria used for inclusion in classification plot data included the following: 1) a near complete vascular species list, 2) plot size scaled to vegetation type (e.g. larger for forests), and 3) cover values for all vascular species. These criteria reflect the minimal standard as discussed in Jennings et al (2002). Nine of twenty nine available legacy data sets evaluated met the criteria for classification (Appendix E). Five data sets are in OLYM and four in MORA or immediately adjacent to and east of MORA and NOCA.

The initial (2006) classification analysis included 2083 plots: 1956 legacy plots and 127 map validation plots from NPS crews. The final classification evaluated 3396 plots: 2479 legacy plots and 917 classification plots from NPS crews.

Observation Points

Legacy plots were used as observation plots when enough information was available to establish a plot into an association but insufficient data was available to describe the vegetation. One MORA data set (Franklin, et al. 1988) lacking tree cover data were classified by estimating relative cover of tree species from tree density by diameter classes. Within this MORA dataset plots in which diagnostic tree species was not clearly exceeding a threshold value or dominance criteria were not used. NPS crews collected new observation points to document the presence and range of previously described associations.

Classification Data Analysis

Plot data is managed in VPRO, developed and managed by the Ministry of Forests, Research Branch (MacKenzie and Klassen 1999). VPRO was designed for British Columbia research ecologists for managing and classifying large bodies of ecological data using standard classification techniques. This Microsoft ACCESS© program allows for tracking plots with species and environmental data, creates stand and synthesis tables, and exports data into the analytical program PC-ORD.

The 2005 classification served as the basis for developing the 2006, 2007 and final classification. It provided structure for initial plot data classification and a basis for comparison of new associations derived from the data. The regionwide CPFC was the basis for classification of forest types as identified and described by Meidinger et al. (2005). Plots were sorted into clusters that fell within the variation of the coastal correlation units using floristic indicators and environmental characteristics described in supporting literature and preliminary keys. Synthesis tables for plots assigned to these pre-existing associations were generated from VPRO and were then subjectively compared to coastal correlation tables and to published tables from supporting literature. Plots not clearly identifiable to pre-existing literature types were analyzed following the general procedure below:

- 1. subset data into physiognomic groupings of tree-dominated (>25% tree cover), shrub-dominated, dwarf shrub-dominated, herbaceous-dominated, and sparsely vegetated (<25% total vascular plant cover) with VPRO;
- 2. subdivide lifeform clusters by PCA or other clustering technique,
- 3. evaluate subdivisions with TWINSPAN and/or stand table manipulation;
- 4. compare clusters to preliminary and pre-existing classification of NPS units, NatureServe or other types in existing literature;
- 5. reiterate process assigning plot individually to plant association; and
- 6. summarize plots per determined type.

New or edited summary descriptions were written for all upland types and forested wetland types. Shrub and herbaceous wetlands and riparian communities are compiled in a list of names of associations organized with by wetland type with little other descriptive information. Descriptions of selected, widespread intermittently flooded and wet meadow associations in alpine and subalpine environments are described.

Following each field season feedback from field crews on the efficacy of preliminary classification and field keys was incorporated into the next iteration of classification. WNHP met with NPS staff to discuss experiences of the field crews and to keep mutually-agreeable progress moving forward. Each year a list of sampling priorities for vegetation classification plots needs were provided for field collection planning to verify type occurrence and increase sampling its range of variation and to sample poorly classified vegetation types, for example, upland shrublands. Field crews were directed to a prioritized sampling scheme, with first priority going towards sampling ecological types that were not well-represented in the current classification (such as dry Douglas-fir forests or avalanche chutes) and associations considered "new" or "ill-defined." Second priority areas were selected to confirm presence and expand range for types that have been described elsewhere but are not known to occur in the parks or have low sample size from the parks, and third priority was to document the occurrence and geographic range of associations that had been described for the region from these parks. In this process, crews were testing the existing key and descriptions.

The 2006 and 2007 field seasons focused on verifying and developing each year's preliminary vegetation classification for MORA, NOCA and OLYM. Each year's preliminary classification incorporated both legacy data from previous vegetation studies on the parks and newly acquired field data collected by NPS crews in the previous year. The plant association classification was complied in a format that could be used by crews to identify plant associations in the field and test the classification.

Alliance is the mapping standard for NPS projects. Alliances are vegetation classification units containing one or more associations and are defined by a characteristic range of species composition, habitat conditions, physiognomy, and diagnostic species, typically at least one of which is found in the uppermost or dominant stratum of the vegetation. NatureServe, in a separate project, will provide the classification and definition of alliances for MORA, NOCA and OLYM. That NatureServe project clusters associations defined in this report into all the revised hierarchical levels in the 2008 FGDC NVC standard. Appendix A arranges associations according to the revised hierarchy. This is the first application of the 2008 NVC hierarchy

(FGDC 2008) to a NPS classification and consequently, the hierarchical organization of the associations in this report is expected to change. The arrangement listed below reflects the hierarchical status developed by NatureServe and partners as of March 31, 2009. Future changes in the classification hierarchy will be available from NatureServe as they are modified (http://www.natureserve.org/explorer/index.htm). The forested portions of the hierarchy was better developed at that date and will likely change less than the non-forest types.

Assessment of State Rarity

A global and state ranking system developed by NatureServe and the Natural Heritage programs is used to estimate conservation priorities. The ranking system facilitates a quick assessment of an entity's rarity. An association is assigned both a global (G) and state (S) rank on a scale of 1 to 5. Global ranks are assigned through a collaborative process involving both NatureServe and individual Natural Heritage Program scientists. State ranks are assigned by scientists within the Natural Heritage Program with the proviso that state rank cannot be rarer than indicated by the global rank.

A rank of G1 indicates critical imperilment on a global basis; the species is at great risk of extinction. S1 indicates critical imperilment within a particular state, regardless of its status elsewhere. A number of factors, such as the total range, the number of occurrences, severity of threats, and resilience contribute to the assignment of global and state ranks. The information supporting these ranks is developed and maintained by the Natural Heritage Program and NatureServe. Only state ranks are present in the association descriptions. Global rank is available on NatureServe explorer for the associations which have been assigned a NatureServe Code.

Uncertainty in conservation rank is expressed as a Range Rank. For example, S2S3 indicates a range of uncertainty such that there is a roughly equal chance of S2 or S3 and other ranks are less likely. A rank of SU expresses that a rank is unable to be assigned to an association due to lack of information or due to conflicting information about status or trends. When the taxonomic distinctiveness of an association is questionable, it is assigned a rank of SQ in combination with a standard numerical S rank, for example S3Q

Ranking for this project considered any previous ranking effort for the association or synonym listed by NatureServe, WNHP or adjacent heritage programs. In estimating the primary rank factor, the number of plots number was used as surrogate for abundance of an association within parks and throughout the state. Observational experience of land-use patterns influencing or threatening the abundance or ecological integrity of associations on and off NPS land was a secondary factor used in estimating ranks.

State Rank definitions:

- S1 critically imperiled
- S2 imperiled
- S3 vulnerable to extirpation or extinction
- S4 apparently secure
- S5 demonstrably widespread, abundant, and secure

Taxonomic Treatments

The primary source of species identification regionally is Hitchcock and Cronquist (1973) although NPS crews used more recent treatments for some species. The standard for the NatureServe IVC/NVC plant association names is Kartesz, J.T. (1999). The 2008 FGDC states: "Nomenclature for vascular plant taxa used in scientific type names should follow the accepted name in USDA PLANTS or ITIS..." with reference to version. For this report, species are synonomized according to Kartesz (2004) and are used in the tables and type descriptions. When the Kartesz (2004) name differs from Hitchcock and Cronquist (1973) in association descriptions, the latter appears in parenthesis preceded with an "=", for example, *Maianthemum* (=Smilacina) stellatum and Agrostis pallens (=diegoensis).

Certain species groups warrant special discussion either from identification difficulties or non-subspecific identification needed to synonomize entities to the current nomenclatural standard. Following NatureServe nomenclatural protocol, when taxa are considered equivalent indicators and/or their field identification easily confused, the entities are included in parenthesis. For example, *Achlys triphylla* and *Achlys californica* are combined and listed as *Achlys (californica, triphylla)*.

Agrostis diegoensis - A. pallens

Kartesz (2004) and ITIS (Aug. 2008) synonomize *Agrostis diegoensis* Vasey under *A. pallens* Trin. Hitchcock and Cronquist (1973), Buckingham and others (1995) and Beik (2000) recognize the former as a dry site species found from sea level to upper treeline and the latter as a coastal sand dune species. This report lists this species as *Agrostis pallens*.

Achlys triphylla - A. californica

Kartesz (2004) and ITIS (Aug. 2008) recognize *Achlys triphylla* (Sm.) DC and *Achlys californica* I. Fukuda & H.G. Baker in Washington while Hitchcock and Cronquist (1973) recognize only the former. Buckingham and others (1995) state that *A. californica* is the common species in forests of the Olympic Peninsula and that *A. triphylla* is only mid-montane to subalpine and mostly in more open habitats. Chappell concludes from field experience that *A. californica* is the exclusive taxon in western Washington. All legacy data (399 plots) lists only *A. triphylla*. Recent NPS plot data lists *A. californica* primarily in OLYM (42 plots) with two plots in MORA. Recent plot data lists 109 MORA plots and 32 OLYM plots as *A. triphylla*. Because legacy data does not distingush *Achlys triphylla* and *Achlys californica*, they are combined and listed as *Achlys (californica, triphylla)*.

Caltha biflora – Caltha leptosepala

Caltha leptosepala is listed in 44 plots (38 legacy), C. biflora in 28 legacy plots and C. leptosepala ssp. howellii 6 plots. Hitchcock and Cronquist (1973) recognize two species of Caltha: C. bifolia DC. (var. rotundifolia (Huth) Hitchc.) and C. leptosepala DC. (var. sulfurea Hitchc.). Kartesz (2004) and ITIS (Aug. 2008) list C. biflora under C. leptosepala ssp. howellii and C. biflora var. rotundifolia under C. leptosepala var. leptosepala. Buckingham and others (1995) in the Olympics and Biek (2000) at Mount Rainier list both subspecies of C. leptosepala. The Flora of North America recognizes only C. leptosepala and no subspecies. For this project, the subspecies are combined and appear as Caltha leptosepala (=biflora, leptosepala).

Festuca ovina

Festuca ovina is listed in 125 legacy plots (27 MORA, 96 OLYM, 2 other), Festuca saximontana appears in 1 OLYM plot, and F. brachyphylla in 1 NOCA and 5 MORA plots. Festuca ovina L. is not native to the Pacific Northwest, Hitchcock and Cronquist (1973) recognized two native varieties: Festuca ovina L. var. brevifolia (R. Br.) Wats. and Festuca ovina L. var. rydbergii St.-Yves. Kartesz (2004) and ITIS (Aug. 2008) list the former under Festuca brachyphylla Schult. ex Schult. & Schult. ssp. brachyphylla and the latter as Festuca saximontana Rydb. var. saximontana. Buckingham and others (1995) lists F. saximontana in alpine habitats on the Olympic Peninsula. Biek (2000) lists F. brachyphylla at Mount Rainier. For this project, Festuca brachyphylla and F. saximontana are combined in the synthesis tables as Festuca (brachyphylla, saximontana) and Olympic data is assumed to be F. saximontana and Cascades data to be F. brachyphylla and discussed as such in the type descriptions.

Lupinus latifolius – Lupinus arcticus ssp. subalpinus

Lupinus arcticus ssp. subalpinus appears in 101 plots, Lupinus latifolius ssp. latifolius in 51 plots and Lupinus latifolius without subspecies in 671 legacy plots. Hitchcock and Cronquist (1973) recognized two varieties of Lupinus latifolius Agardh: subalpinus (Piper & B.L. Rob.) and latifolius. Kartesz (2004) and ITIS (Aug. 2008) lists the former as a synonym of Lupinus arcticus S. Watson ssp. subalpinus (Piper & B.L. Rob.) D. Dunn and the latter as a synonym of Lupinus latifolius Lindl. ex J. Agardh ssp. latifolius. Buckingham and others (1995) describe the habitat of L. latifolius as "open" and L. arcticus as "scree" and both occurring at subalpine elevations. Biek (2000) at Mount Rainier notes that L. latifolius is common below 5000 feet in forest openings and that L. arcticus is the dominant subalpine meadow lupine species. Plots with a subspecies determination do not clearly segregate by habitat. Additionally, field crews found species identification difficult. As a result, Lupinus arcticus ssp. subalpinus and Lupinus latifolius ssp. latifolius are combined and listed as Lupinus (arcticus ssp. subalpinus, latifolius).

Lupinus lepidus – Lupinus sellulus

Lupinus lepidus appears in 63 plots (61 legacy) and Lupinus sellulus Kellogg var. lobbii in 50 plots (47 legacy). Hitchcock and Cronquist (1973) recognized five varieties of Lupinus lepidus Dougl.including var. lobbii (Gray) Hitchc. Kartesz (2003) and ITIS (Aug. 2008) synonomize that variety under Lupinus sellulus Kellogg ssp. sellulus var. lobbii (Gray ex S. Wats) Cox. Because all legacy plots are high elevation and L. lepidus Dougl. ex Lindel is a lowland western Washington species and the other Hitchcock and Cronquist (1973) varieties are outside of the range of the national parks surveyed, L. lepidus in all legacy plots are considered Lupinus sellulus Kellogg var. lobbii.

Luzula campestris

Luzula campestris (L.) DC is an uncommon introduced weed at low elevations, <u>not</u> typically occurring in naturally vegetated areas (Flora of North America). It is listed in 247 plots (19 NOCA, 10 MORA, 217 OLYM, 1 other), 229 of which are legacy plots all of which are assumed to be in naturally vegetated areas. According to the University of Washington Burke Museum Herbarium: "The name Luzula campestris has long been misapplied to several of our species of Luzula, including L. comosa and L. multiflora. Hitchock and Cronquist's treatment of L. campestris is incorrect; see Flora of North America Volume 22 for accurate treatments." Hitchock and Cronquist (1973) recognized three varieties: congesta (Thuill.) Mey., frigida

Buch. and *multiflora* (Ehrh.) Celek. ITIS (Aug. 2008) lists all three *L. campestris* varieties as *L. campestris*. Kartesz (2004) and ITIS (Aug. 2008) list *L. campestris* var. *congesta* (Thuill.) Mey. under *L. congesta* (Thuill.) Lej. (4 plots). The Washington Flora Checklist (October 2008 http://biology.burke.washington.edu/waflora/checklist.php) and Beik (2000) consider *L. congesta* and *L. comosa* the same enitity – *L. comosa* E. Mey. This species is native to forest openings up to alpine. Kartesz (2004) and ITIS (Aug. 2008) list *L. campestris* var. *multiflora* (Ehrh.) Celak under *L. multiflora* var. *multiflora* (13 plots) which is an introduced species that grows in grasslands at low elevations. Kartesz (2004) and ITIS (Aug. 2008) synonomize *L. campestris* ssp. *frigida* Buch. under *L. multiflora* (ssp. *frigida* (Buch.) Krecz. which according to the Washington Flora Checklist (October 2008)

http://biology.burke.washington.edu/waflora/checklist.php), is the introduced species *L. multiflora*. For this project, *Luzula campestris* is assumed to be *Luzula multiflora* or *L. comosa* because of its assumed native habitat and is listed as *Luzula* (comosa, multiflora) in tables and descriptions of low elevation associations. Higher elevation associations are assumed to be native vegetation and are listed as *Luzula comosa* (=campestris, congesta) in the association descriptions.

Luzula divaricata

Luzula divaricata is listed in 4 MORA plots. Kartesz (2004) does not recognize *L. divaricata* S. Wats.in Washington although ITIS (Aug. 2008) accepts that entity. According to the Washington Flora Checklist (October 2008

http://biology.burke.washington.edu/waflora/checklist.php) *Luzula divaricata*, is misapplied in Hitchcock and Cronquist (1973) and is *L. parviflora* (Ehrh.) Desv. For this project, *Luzula divaricata* is considered *L. parviflora*.

Oxalis oregana – O. trilliifolia

Kartesz (2004), ITIS (Aug. 2008), and Hitchcock and Cronquist (1973) recognize *Oxalis* oregana Nutt. and *O. trilliifolia* Hook. in Washington. Buckingham and others (1995) lists only *O. oregana* as the common species in forests of the Olympic Peninsula. Beik (2000) lists *Oxalis* oregana as common below 762 m (2500 ft) and *O. trilliifolia* less commonly and appearing to higher elevations at Mount Rainier. Plot data (159 plots) lists only *O. oregana*. NatureServe lists a plant association in Oregon and Washington (that occurs in MORA and OLYM) as *Oxalis* (oregana, trilliifolia). That association name is retained.

Solidago spathulata

Kunth and *Solidago spathulata* DC var. *nana* (Gray) Cronq.under *S. simplex* Kunth ssp. *simplex* Var. *nana* (Gray) Ringus (7 MORA legacy plots). Beik (2000) only recognizes *S. simplex* Kunth ssp. *simplex* var. *nana* (Gray) Ringus at Mount Rainier. For this project, all *Solidago spathulata* is considered to be *S. simplex* var. *nana*.

Vaccinium alaskaense (V. alaskaensis)

Kartesz (1999) synonomized *Vaccinium alaskaense* and *V. ovalifolium* under *V. alaskaensis* and NatureServe retains this treatment. Kartesz (2004) recognized *V. alaskaensis* and *V. ovalifolium* as a separate species. USDA PLANTS and ITIS (Aug. 2008) list *V. alaskaense* as in Hitchcock and Cronquest (1973). This report uses *Vaccinium alaskaense* and *V. ovalifolium*.

Results

Plant Association Descriptions

Final descriptions represent how plant associations appear, on average, at MORA, NOCA and OLYM (Appendix A). The descriptions are based on summarized plot data and existing literature. A total of 311 upland and forested wetland types are described. Over half (188) of the described associations are tree-dominated, 53 are shrub-dominated, 43 are herbaceous-dominated and 27 are sparse or lithomorphic vegetation types. Of those associations, 49 may occur in the parks based on description from literature in adjacent areas but are not represented by current plot data from within park boundaries.

Most of the described associations (153) are represented by data collected in five or more plots from MORA, NOCA and/or OLYM. Table 2 summarizes the number of plots which support plant associations, organized by life form categories. Fourteen variants of associations (20 plots) are discussed within the context of one of the described associations but appear separately in the synthesis tables (Appendix C). Global (rangewide) descriptions are not included in this report. A limited set of global association descriptions are available on NatureServe explorer.

Table 2. Numbers of plant associations within plot number and life-form categories at MORA, NOCA and OLYM.

	Number of Plots				
Life form Category	0	1	2 - 4	5 +	Total Associations
Tree	39	27	37	85	188
Shrub	5	10	12	26	53
Herbaceous	4	5	9	25	43
Sparse	1	3	8	15	27
Total Associations	49	44	66	153	311

Each description includes scientific name, common name, a NatureServe Code when present, acronym (that cross-references to synthesis tables), national vegetation hierarchy levels including alliance, classification confidence, range in Washington, environmental features, USFWS wetland classification, vegetation description, state conservation rank, rank justification, comments, and plant association synonyms in previous classifications.

A field key to plant association identification preceeds the association descriptions, in Appendix A. Supporting synthesis tables of these associations are organized in Appendix C. The synthesis table lists a subset of species found in each association, with constancy and average cover values. Appendix D presents a summary of a selected set of environmental characteristics sampled for each association at MORA, NOCA, and OLYM.

Appendix B provides 50 additional shrub and herbaceous wetland associations compiled from NatureServe, WNHP classification, literature and field experience that occur or can possibly occur in the parks. Over half (38) of those associations are supported in the current plot data. Appendix B provides the list of those wetland associations in preliminary field key format. Each wetland association includes scientific name, common name, NatureServe Code, acronym (that cross-references to synthesis tables), range in Washington, and environmental features. Larger-scale tree and shrub-dominated wetlands (7 tree-dominated and 2 shrub-dominated associations) and riparian vegetation (18 tree-dominated and 9 shrub-dominated associations) are described and represent by plot data in Appendix E. An additional four wetland and eight riparian tree-dominated associations are described from literature without plot representation but likely to occur in the parks. Fifty herbaceous wetland associations that probably occur in the parks are provided, twenty-two of which have at least one representative plot.

The 2005 preliminary classification, based on literature and existing knowledge, identified 195 probable associations: 142 tree-dominated, 25 shrub-dominated, 23 herbaceous-dominated, and 5 sparse vegetation types. Forty-four of those preliminary associations were then not supported by plot data from the parks, 141 were represented by plot data from the parks, and ten were considered variants of associations and were merged or split into other types.

The final classification step added an additional 126 associations. 54 tree-dominated, 28 shrub-dominated, 22 herbaceous-dominated, and 22 sparse vegetation types. Five of those additional associations are not currently supported by plot data but are described in literature as on or near MORA, NOCA, or OLYM. Fourteen of the added associations are recognized in the current NVC or are included in the coastal correlation (Meidinger 2005). Twenty are related to current NVC associations and, if not accepted as new associations, would expand the geographic range or floristic variation of the current NVC association. Eighteen are new association concepts with support in the classification literature and 40 represent entirely new association concepts generated by sampling in the parks. The remaining additional associations are provisionally recognized and most are represented by a single plot. They fall within the following general categories: avalanche tracks, lahar or debris surfaces or riparian flood terraces (22) or are map assessment plots (7) that could either represent more widespread types or prove to be outliers during subsequent mapping efforts.

An evaluation of the number of plots per park may be used to assess the relative coverage of the classification sampling effort. OLYM has the most plots-1661, followed by MORA- 931 plots and NOCA- 272. The latter two parks are augmented by 270 plots from within approximately10 miles of their eastern boundaries. Forests are the dominant physiognomic class on all parks and the plot distribution reflects that characteristic. OLYM has the widest representation of physiognomic categories among the parks (Table 3). Sparse vegetation sampling is least represented at NOCA. That vegetation type is classified primarily from plots on OLYM and is probably the least represented category in this classification.

Table 3. The distribution of final plots expressed as percent by physiognomic category among MORA, NOCA, and OLYM.

Lifeform Category	Percentage of Plots				
	MORA	NOCA	OLYM	Other	All Parks
Tree	72.4%	64.7%	37.4%	41.5%	50.7%
Shrub	14.7%	23.5%	18.6%	20.7%	18.1%
Herbaceous	10.4%	11.4%	26.1%	33.7%	20.9%
Sparse	2.5%	0.4%	17.9%	4.1%	10.7%
Total Plots	931	272	1661	270	3134

Legacy plots represent over half of the plots used in classification, with most of those from OLYM. NOCA has no legacy plots (Table 4). In addition, OLYM has the greatest number and NOCA the least of the NPS crew plots. In spite of the lowest overall sampling, NOCA has the highest percentage of NPS herbaceous plots.

Table 4. The distribution of legacy and NPS plots expressed as percent by physiognomic category among MORA, NOCA, and OLYM.

Lifeform Category	Percentage of Legacy Plots			
	MORA	OLYM	Other	All Parks
Tree	76.0%	27.4%	41.5%	42.7%
Shrub	8.5%	19.2%	20.7%	16.4%
Herbaceous	12.7%	31.1%	33.7%	26.3%
Sparse	2.7%	22.3%	4.1%	14.6%
Total Plots	622	1338	270	2230
Lifeform Category	Percentage of NPS Plots			
	MORA	NOCA	OLYM	All Parks
Tree	65.0%	64.7%	78.6%	69.8%
Shrub	27.2%	23.5%	16.1%	22.1%
Herbaceous	5.8%	11.4%	5.3%	7.3%
Sparse	1.9%	0.4%	0.0%	0.8%
Total Plots	309	272	323	904

Association Results

The most sampled plant associations by physiognomic group give an indication (sampling is not random) of their relative abundance within the parks. The most sampled forest associations are subalpine types: *Tsuga mertensiana-Abies amabilis/Rhododendron albiflorum* Forest (66 plots),

Abies lasiocarpa-(Abies amabilis)/Vaccinium membranaceum/Valeriana sitchensis Forest (52 plots), and upper montane types *Tsuga heterophylla-Abies amabilis/Vaccinium alaskaense/Rubus pedatus* Forest (45 plots), *Abies amabilis/Vaccinium membranaceum /Rubus lasiococcus* Forest (44 plots), and *Tsuga heterophylla-Abies amabilis-(Pseudotsuga menziesii)/Vaccinium alaskaense* Forest (41 plots).

The most sampled shrub associations are alpine and subalpine dwarf-shrub types: *Phyllodoce empetriformis-Vaccinium deliciosum-(Cassiope mertensiana)* Subalpine Dwarf-shrubland (102 plots), *Cassiope mertensiana-Phyllodoce empetriformis* Alpine Dwarf-shrubland (65 plots), and *Vaccinium deliciosum* Dwarf-shrubland (52 plots), *Juniperus communis-(Phlox diffusa)* Dwarf-shrubland (40 plots), and the avalanche/riparian-associated tall shrubland *Alnus viridis ssp. sinuata-Rubus spectabilis/Athyrium filix-femina* Shrubland (27 plots).

The most sampled herbaceous associations are high elevation mesic grassland and forb meadows: *Luetkea pectinata* Herbaceous Vegetation (71 plots), *Carex spectabilis-(Lupinus (arcticus, latifolius)-Polygonum bistortoides* Herbaceous Vegetation (64 plots), *Phlox diffusa-(Lomatium martindalei-Carex phaeocephala)* Herbaceous Vegetation (55 plots), and *Lupinus (arcticus ssp. subalpinus, latifolius)* Herbaceous Vegetation (47 plots) and alpine/subalpine grassland *Festuca roemeri-(Phlox diffusa-Arenaria capillaris)* Herbaceous Vegetation (52 plots). These summaries are mostly legacy plots.

The most sampled sparse association are *Astragalus cottonii* Lithomorphic Vegetation (48 plots), *Phlox diffusa* Lithomorphic Vegetation (34 plots), *Juniperus communis* Lithomorphic Vegetation (25 plots), *Phacelia hastata* Lithomorphic Vegetation (24 plots), and *Delphinium glareosum* Lithomorphic Vegetation (23 plots). These are mostly OLYM legacy plots.

Preliminary associations represent new associations to the NVC. Over half of the preliminary forest associations are supported by descriptions in the literature. Those forest associations without supporting literature appear in two general categories: 1) new classification units representing existing vegetation that were only implicitly recognized in previous Pacific Northwest forest association classifications that emphasized late seral vegetation. An example is the *Pseudotsuga menziesii/Achlys triphylla* Forest, and 2) associations with affinities to complex classification units found east of the Cascade crest in Washington and British Columbia, for example *Abies lasiocarpa-Pseudotsuga menziesii/Mahonia nervosa* Forest. Most preliminary sparse vegetation types represent new vegetation classification units that were underrepresented or not sampled in previous classification work in the region.

Imperiled Associations

The classification includes seven associations ranked S1 (indicating critical imperilment within the state of Washington), eighteen ranked S2 (imperiled) and eight associations have a range rank of S1S2 (critically imperiled or imperiled). Ranks of S1 to S2 are an estimate of rarity based on restricted or unique habitat and/or threatened habitats. Six of the S1 associations occur in restricted habitats although three coastal forest associations (*Picea sitchensis/Maianthemum dilatatum, Picea sitchensis/Vaccinium ovatum,* and *Tsuga heterophylla-Abies amabilis-(Thuja plicata)/Vaccinium alaskaense/Blechnum spicant* Forests) have been reduced in overall ecological quality by past timber harvesting on and off national park land. Three S1 grassland

associations (Calamagrostis nutkaensis-Vicia nigra ssp. gigantea-(Equisetum telmateia), Festuca roemeri-Cerastium arvense-Koeleria macrantha and Festuca roemeri-Plectritis congesta Herbaceous associations) are restricted environmentally to forest openings and are threatened by exotic species invasion with site disturbance and tree invasion, particularly the Festuca roemeri associations. The Pinus ponderosa/Pseudoroegneria spicata Woodland association which is possible at NOCA, previously had a wider range in Washington but its extent has been greatly reduced due to removal of larger trees, fire suppression and invasive species.

Three S1S2 associations are occur along OLYM's narrow wilderness coast. The *Thuja plicata*-Tsuga heterophylla/Lysichiton americanus/Sphagnum spp. Woodland is found only in coastal bogs and fens. Thuja plicata-Tsuga heterophylla/Vaccinium ovatum Forest, a very late-seral stage forest and Tsuga heterophylla-Thuja plicata-(Abies amabilis)/Gaultheria shallon/Blechnum spicant Forest occur only along the coast as regionally endemic associations. Non- protected lands supporting the latter two associations along the coast have largely been converted or modified by logging. Two S1S2 whitebark pine communities are fairly widely distributed but restricted to small patches in the high elevations of the eastern Cascades in northern Washington and OLYM. The ecological condition of occurrences is declining due to *Pinus albicaulis* mortality from fire exclusion and white pine blister rust (*Cronartium ribicola*). As result, the Pinus albicaulis/Festuca viridula Woodland and Pinus albicaulis-(Tsuga mertensiana)/Luzula glabrata var. hitchcockii Woodland associations are increasingly rare, and are likely to continue to decline. The non-forest S1S2 associations are Vaccinium deliciosum-Tauschia stricklandii Dwarf-shrubland, endemic to MORA, occurs in small patches in subalpine settings where recreational impacts of trampling and trail proliferation pose a possible threat, and Koeleria macrantha-(Agrostis pallens) Herbaceous Vegetation found only on balds in the Cascades is subject to tree and exotic species invasions.

Fifteen of the eighteen S2 associations are restricted environmentally, four are wetland or riparian forest types, five are subalpine woodlands, three are subalpine or alpine herbaceous types, two are forest associations with east Cascade affinities and one is a grassland bald. Three S2 associations are less restricted environmentally but have reduced occurrences due to vegetation alteration from timber harvesting and land conversion (*Pseudotsuga menziesii/Gaultheria shallon-Holodiscus discolor* and *Pinus contorta var. contorta-Pseudotsuga menziesii/Gaultheria shallon* Forest associations. nly the former has been confirmed on OLYM) One S2 association possible at NOCA (*Purshia tridentata/Pseudoroegneria spicata* Shrubland) is subject to both land conversion and exotic species invasion.

Discussion

Contributions of This Work

Prior to this project, vegetation sampling and classification concentrated on the abundant forest landscape on and off park lands and on special environments at high elevation, primarily alpine and subalpine dwarf-shrubland and herbaceous vegetation. The targeted sampling effort has allowed some physiognomic or ecologic niches such as avalanche tracks or montane shrublands to be better understood in the region. As directed, the NPS crews accumulated 109 shrub plots that contributed to defining forty of fifty-two shrubland associations in this document. Specifically, variation within thirteen NVC (NatureServe) shrubland associations was described and verified as being on NPS land. Eleven associations that were tentatively recognized from literature and field experience were newly described and verified as occurring within the parks. Provisionally, eight new associations are described pending more survey beyond NPS land to verify the range of variation of types or their relationship to associations recognized elsewhere. These associations provide a foundation from which to more fully describe shrublands and their relationships to natural processes in the Pacific Northwest.

This project provided the opportunity to test the classification of new associations and revisions to the existing NatureServe (2005) from the coastal forests correlation project (CFCP) (Meidinger et al. 2005), since the results of that multi-jurisdictional project served as the basis for forest classification. This project confirmed eighty-seven NatureServe and forty-four CFCP associations as recognizable units and as being on NPS land. Twenty-seven new forest associations were described not previous recognized by NatureServe or the CFCP. Nine of those types represent new associations not currently recognized elsewhere. Provisionally, thirty-four new forest associations are pending more survey or analysis beyond NPS land to verify the range of variation of types or their relationship to associations recognized elsewhere.

Because most of the non-forest alpine and subalpine vegetation in the coastal Pacific Northwest occurs on MORA, NOCA and OLYM, this project provided the opportunity to evaluate its classification through comparison of both legacy data and new NPS data. This project clarified the classification and distribution of twenty-one previously recognized NVC high-elevation non-forest associations and more formally recognized nine new associations cited from literature. An additional eleven new non-forest associations were described to better characterize this high-elevation landscape. Eight provisonal associations were proposed pending more survey or analysis beyond NPS land to verify the range of variation of types or their relationship to associations recognized elsewhere.

Not only has this project filled in gaps and clarified previous classification efforts, this work greatly contributes to the regional and even national organization of vegetation information. Through cooperative project with NatureServe, the association level classification developed for these parks is being used to develop the 2008 NVC hierarchy for the region. Associations provide the reference for evaluating relationships among the various upper levels of the NVC. NatureServe collaborated with WNHP to develop the alliance-level concepts for these classifications by providing a review of the analytical results, review of the plant associations determined by WNHP and wrote descriptions for the alliances and alliance groups with input

from WNHP. This work included determination of all plant associations and their relationship to alliance, group level and other higher levels of the Pacific Northwest portion of the new NVC hierarchy.

This project helps clarify the important role MORA, NOCA and OLYM play in the protection of state and globally rare vegetation. Through sampling and developing the classification, eighteen state critically imperiled or imperiled associations are recognized and confirmed on national parks. These state rare associations are **not** confined to national parks and are located in appropriate environments elsewhere in the state. The parks though support important protection of some of the least altered representatives of these types in Washington, particularly low elevation forests along the coast strip and foothills of OLYM. High elevation forest, woodlands and grasslands are well represented in all the parks and offer the most natural setting for representation of those associations in the state.

Gaps in the Classification

In contrast to using a systematic stratified, or gradient-transect sampling approach to sampling the landscape, the NPS field crews were directed to sample plots that would 1) augment the description and distribution of known associations and 2) sample vegetation not represented in the current classification, for example shrub-dominated vegetation. This approach allowed the NPS to take maximum advantage of previous regional classification work, and seemed the best viable option for 12 people to sample nearly 2 million acres during only 2 field seasons.

From a whole-park perspective, the classification for OLYM is likely the most complete based on total plots and range of physiognomic categories classified. MORA is well represented in forest classification and appears to also be well represented in shrub and herbaceous classification. In contrast, NOCA is the least sampled and contains a complex of vegetation for which the classification is most likely to need further modifications and updates during mapping.

This project's objective was to provide a vegetation classification that would support planned vegetation mapping, consequently, minimal effort went to sampling small-scale associations such as those occurring within wetland patches. Additionally, wetland vegetation is under sampled because it requires a different sampling protocol and additional training of field personnel. Although larger forested and shrub wetlands are fairly described, more the half of the wetland herb types that are likely to occur in the parks are not sampled.

Sparsely vegetated areas or lithomorphic vegetation was largely unsampled during this project and are represented mostly by legacy plots from OLYM. Sparse areas pose unique challenges for both sampling and classification analysis because of their low species diversity, importance of non-vascular species, small patch size and high landscape heterogeneity. Developing a better classification for these small-scale associations would require a higher sampling intensity than was supported. Furthermore, these associations are found in some of the most difficult terrain to access in the parks.

In addition to addressing these known gaps, further sampling may help reduce confusion between certain types. Associations identified in this project as CFCP types (Meidinger et al. 2005) that are represented by only a few plots and have distributions primarily north in BC or

south in Oregon would benefit from further clarification. For example, the *Populus balsamifera ssp. trichocarpa-Alnus rubra/Carex obnupta* association as recognized in this report is the CFCP *Populus balsamifera* spp. *trichocarpa/ Cornus sericea/Carex obnupta* (PNWCOAST_113). Inclusion of these western Olympic plots with this type expanded the Puget Trough/Georgia Strait concept to include riverine associated wetlands, a much wetter climate, and differing associated species. The *Pseudotsuga menziesii-(Abies grandis)/Acer circinatum/Polystichum munitum* association is a newly recognized association in this report as a result of the coastal correlation from northwest Oregon and new in Washington. Although not represented in the current data for national parks in Washington further sampling is needed to better characterize this association in Washington.

Provisional types in this report also indicate gaps or need for addition classification attention. Many provisional units are placeholders for groups of plots that can be classified to alliance or higher hierarchical levels, such as *Ceanothus velutinus* Shrubland, *Spiraea splendens* Shrubland and *Vaccinium scoparium* Shrubland. Other provisional types defined from park plots appear to be variants of vegetation described elsewhere, for example *Cupressus nootkatensis /Vaccinium deliciosum* Provisional Forest appears to be a variant of *Tsuga mertensiana/Phyllodoce empetriformis-Vaccinium deliciosum*. The *Pseudotsuga menziesii-(Pinus ponderosa / Symphoricarpos albus* Provisional Forest is either a variant of or is the same as *Pseudotsuga menziesii/Symphoricarpos albus* Forest found in the east Cascades and Northern Rockies.

Future Directions

This report summarizes current available data and literature, and therefore represents the latest approximation of the plant associations on MORA, NOCA and OLYM. Continuation of this project into a vegetation mapping phase undoubtedly will reveal associations not covered in the current classification or will add to the variation described by it. The WNHP coordinates with NatureServe to maintain and update the NVC and will continue in that role during the mapping phases of the project. A final approximation of the plant associations of MORA, NOCA and OLYM will incorporate new sampling and any updates to this classification will be incorporated into the NVC.

Conclusions

The project met its goal of developing a single vegetation classification of plant associations for MORA, NOCA and OLYM. The plant associations described in Appendix A reflect the most current and comprehensive vegetation classification not only for the parks, but for the region. This work also represents a philosophical shift in this region from describing and mapping vegetation based on potential vegetation relative to bioclimatic zones to one that is based on existing vegetation. The field keys and descriptions which comprise this report will provide NPS staff, natural resource managers from other agencies, and researchers the tools necessary to sample vegetation in a manner that will closely tie their work to the forthcoming NPS vegetation maps. The combined NCCN classification and mapping work not only provides park managers information for land use decisions, but also informs park visitors, guides research and will serve as a baseline against which to evaluate future vegetation change.

Vegetation Classification of Mount Rainier, North Cascades, and Olympic National Parks

Plant Association Descriptions and Identification Keys: Appendices

Appendix A. Key to and descriptions of the plant associations of the Mount Rainier, North Cascades including the Chelan National Recreation Area, and Olympic National Parks.

Appendix B. Preliminary key to wetland and riparian plant associations of the Mount Rainier, North Cascades including the Chelan National Recreation Area, and Olympic National Parks.

Appendix C. Synthesis Tables of plant associations sampled at Mount Rainier, North Cascades including the Chelan National Recreation Area, and Olympic.

Appendix D. Environmental variables of plant associations sampled at Mount Rainier, North Cascades including the Chelan National Recreation Area, and Olympic National Parks.

Appendix E. Legacy plot data evaluated at Mount Rainier, North Cascades including the Chelan National Recreation Area, and Olympic National Parks.

Appendix F. Literature cited in descriptions of plant associations of the Mount Rainier, North Cascades including the Chelan National Recreation Area, and Olympic National Parks.

Appendix G. Sampling instructions and field forms used at Mount Rainier, North Cascades including the Chelan National Recreation Area, and Olympic National Parks.

The Natural Resource Publication series addresses natural resource topics that are of interest and applicability to a broad readership in the National Park Service and to others in the management of natural resources, including the scientific community, the public, and the NPS conservation and environmental constituencies. Manuscripts are peer-reviewed to ensure that the information is scientifically credible, technically accurate, appropriately written for the intended audience, and is designed and published in a professional manner.

Natural Resource Technical Reports are the designated medium for disseminating the peer-reviewed results of scientific studies in the physical, biological and social sciences for both the advancement of science and the achievement of the National Park Service's mission. The reports provide contributors with a forum for displaying comprehensive data that are often deleted from journal because of page limitations. Current examples of such reports include the results of research that addresses natural resource management issues; natural resource inventory and monitoring activities; resource assessment reports; scientific literature reviews; and peer reviewed proceedings of technical workshops, conferences, or symposia.

Views, statements, findings, conclusions, recommendations and data in this report are solely those of the author(s) and do not necessarily reflect views and policies of the U.S. Department of the Interior, NPS. Mention of trade names or commercial products does not constitute endorsement or recommendation for use by the National Park Service.

Printed copies of reports in these series may be produced in a limited quantity and they are only available as long as the supply lasts. This report is also available from the Natural Resource Publications Management website (http://www.nature.nps.gov/publications/NRPM) on the internet.

Appendix A. Key to and descriptions of the plant associations of the North Cascades including the Chelan National Recreation Area, Olympic and Mount Rainier National Parks.

Introduction

Appendix A contains the field key and descriptions of plant associations found during this project. These are placed in the same section to facilitate easier movement between key and description.

Plant Association Key

The key is constructed as a field key. The following explains features and application of the key in the field.

- Select a relatively uniform area of vegetation and topography to key out. A representative
 plot is a simple way to examine a stand, just be sure the plot represents the stand of
 interest.
- 2. "Present" means the species is typically found on a representative plot, i.e. it regularly occurs in the stand. "Prominent" means the species occurs with 3-15% cover
- 3. If the stand or plot meets the criteria in a line, then read to the right or (if blank) to the next indented line down. If the stand or plot does not meet the criteria, then go to the next line down that is not indented from the current line.
- 4. Some associations key to multiple different lines. For associations that may be distinguished by any one of a number of different characteristics, the criteria are broken into multiple lines so as to avoid excessive and confusing use of "and" and "or" statements. Go to the next line down if the criteria are not met.
- 5. Percentage values refer to crown cover, that is, the vertical projection below the entire crown of the plant, do not subtract for spaces between leaves and branches
- 6. "+" = add the crown cover of each of the species indicated, e.g. 7+22 = 29% cover, overlap between the species gets counted twice. One species may be absent.
- 7. The park or parks where the association occurs or likely occurs are listed at each selection as MORA (Mount Rainier), NOCA (North Cascade) or OLYM (Olympic).
- 8. Wetland associations located or possibly located in one or all the parks appear in Appendix B and are referenced in the physiognomic section of the key.
- 9. The key is not the classification. After you have keyed out a stand, always read the association description of vegetation composition, geographic distribution, and physical environment. If it sounds like it fits in most regards, you have made a correct identification. If there are multiple inconsistencies between the stand and the description, the key probably was incorrect. In this case, you probably need to try the key again and follow slightly different leads or identify the stand by reading the descriptions. There are also many undescribed communities in the area and the key does not deal with non-forested wetlands or riparian communities for the most part, so the vegetation you are looking at may be an undescribed type.

Key to Physiognomic Categories: (page numbers refer to key)

Trees > 25%, or stand is a tree island in subalpine parkland Deciduous broadleaf trees clearly > canopy cover than conifer trees Key to Deciduous Forest Types p. 3 Conifer trees approximately equal in canopy cover or > than deciduous broadleaf trees Shrubs (taller than 0.5 m) or shrub-form trees (krummholz) > 25%..... Site occurs in a landform where groundwater discharge and/or overbank flooding heavily influence vegetation composition (e.g. seeps/springs, depressions, riparian areas); soils can be organic (fibrous or woody peat or muck) or mineral; includes shrub swamps and fens. Site occurs in an upland environment such as steep slopes, rocky and/or well-drained soils, or other areas where surface and/or groundwater do not affect vegetation composition Key to Upland Shrubland Types, p. 13 Herbaceous Vegetation > 25% Site occurs in a landform where surface water accumulates or groundwater discharges (e.g. marsh, wet meadow, fen, or aquatic bed); may be near late-lying snowbeds; water table near, at, or above soil surface for significant portion of growing season; soil very moist to saturated, although may be dry in late summer/early fall; organic soils may be present; Site is aquatic and permanently flooded; standing water can be up to several feet above the soil surface; rooted vegetation may be submerged or emergent; some vegetation may be or appear to be floating; includes ponds, lakes, oxbows, etc.; Characteristic species include Utricularia, Brasenia, Elodea, Nuphar, Potamogeton, Ranunculus (aquatilis), Sparganium, and Lemna...... Key to Aquatic Bed Vegetation Appendix B Site is seasonally to semi-permanently flooded; vegetation typically taller than in wet meadows or fens; topography flat or nearly so; includes marshes found along perimeter of beaver ponds, lakes, and in depressions; Characteristic species include Carex exsiccata, C. obnupta, Hippuris vulgaris, Schoenoplectus (acutus, tabernaemontani, Juncus effusus, Menyanthes trifoliata, Oenanthe sarmentosa Key to Freshwater Marsh Vegetation Appendix B Site has organic soils: standing water, if present, rarely more than a few inches above the soil surface; soils are typically saturated year-round; some sites may have hummocks; Sphagnum or "brown" mosses may be abundant; Graminoids typically dominate but forbs can be abundant; Characteristic species include Carex aquatilis var. dives, C. utriculata, C. livida, C. nigricans, C. limosa, C. lenticularis, C. interior, C. utriculata, C. exsiccata, Dulichium arundinaceum, Eleocharis quinqueflora, E. palustris, Trichophorum caespitosum, Rhynchospora alba, Eriophorum spp., Comarum palustre, Calamagrostis canadensis, Menyanthes trifoliata., and Caltha leptosepala..... Key to Bog or Fen Vegetation Appendix B Site has mineral soils; seasonal standing water may be present early in the growing season: sites typically dry out by late summer/early fall. However, early season flooding or soil saturation result in distinctive wetland vegetation; forbs are typically more abundant than previous, however graminoids can be dominant. Key to Wet Meadow Vegetation Appendix B Site occurs in an upland environment (steep slopes, rocky and/or well-drained soils, other areas where surface and/or groundwater do not affect vegetation); may be near early melting snowbeds; soils are rarely saturated (and if so, only in early spring) but can be moist; organic soils or even organic soil horizons not present; Key to Herbaceous Upland Vegetation p. 16

Herbaceous Vegetation < 25%.. Key to Bryophyte and Lithomorphic Sparse Vegetation Types p. 18

Plant Community Descriptions

Plant association descriptions are alphabetized as they appear in the key within physiognomic category and by dominance type in forest associations. Each association description summary includes scientific name, common name, NatureServe code when present, acronym, selected national vegetation hierarchy, classification confidence, range in Washington, environmental features, U.S.F.W.S. wetland classification, vegetation description, state conservation rank, rank justification, comments, and plant association synonyms in previous classifications.

Plant association scientific name uses the naming conventions in the NVC (FDGC 2008). Plant species in the name are dominant (cover the greatest area) and diagnostic or differential (found consistently in some vegetation types but not others). At least one species from the dominant and/or uppermost stratum is included in each name. A hyphen ("-") indicates species occurring in the same stratum. A slash ("/") indicates species occurring in different strata. Species that occur in the uppermost stratum are listed first, followed successively by those in lower strata. Order of species names generally reflects decreasing levels of dominance, constancy, or indicator value.

The following terms are used to describe the distribution and abundance of individual species within each plant association.

<u>Dominant</u> – clearly the most abundant species in a well-developed stratum of vegetation <u>Co-dominant</u> – one of two to four species that share dominance in a well-developed stratum of vegetation (usually percent cover is in the range of 5 or 10 to 50 percent)

Prominent – species has cover in the range of about 3 to 15 percent

Present – species found on plot with less than about 3 percent cover

Usually – more than 60% of the time or 60% of plots

Sometimes – 40-60% of the time

Occasionally – 10-40% of the time

Well-developed layer – stratum of vegetation typically >10% cover

The NatureServe Code indicates the current classification status of the association in the NatureServe NVC. That field includes the following:

- Codes starting with CEGL appear on NatureServe (November 2008) explorer (http://www.natureserve.org/explorer/index.htm) and represent associations accepted as global associations.
- Codes starting with PNW represent new associations and revisions to NatureServe from the coastal forests correlation project (Meidinger et al. 2005). Codes are assigned by NatureServe (2005).
- "Preliminary" indicates new associations developed for this project. These associations
 are usually represented by five or more plots and may appear in regional or state plant
 community classification literature. Some preliminary associations have less than five
 plots but are supported in the literature.
- 4. "Provisional" indicates a potential association that usually has fewer than five plots and no literature support. They represent known or likely cover and dominance types or low confidence plant associations. Provisional types are included in this report to provide a placeholder that is categorized in higher NVC hierarchy levels for mapping purposes.

Acronyms are plant association scientific names listed by the first three letters of the genus and the species. For example, LARLYA/VACDEL is the *Larix Iyallii/Vaccinium deliciosum* association. Acronyms cross-reference to the dichotomous key and to synthesis tables in Appendix C.

The national vegetation hierarchy levels in the description include Macrogroup, Group and Alliance. This is the first application of the 2008 NVC hierarchy (FGDC 2008) to a NPS classification and

consequently, the hierarchical organization of the associations in this report is expected to change. The arrangement listed below reflects the hierarchical status developed by NatureServe and partners as of March 31, 2009. Future changes in the classification hierarchy will be available from NatureServe (http://www.natureserve.org/explorer/index.htm) as modified.

Classification confidence indicates the level of confidence in the classification of the association or based on the quality and type of data used in the analysis, as well as the extent to which the entire (or potential) range type was considered. Values include: 1 = Strong, 2 = Moderate, and 3 = Weak.

Synonym lists plant associations or plant community types with more, less, or equivalent concept. Full citations are in the Reference cited.

Pseudotsuga menziesii/Gaultheria shallon-Holodiscus discolor Forest

Douglas-fir/Salal-Oceanspray Forest

<u>Acronym</u>: PSEMEN/GAUSHA-HOLDIS <u>NatureServe Code</u>: PNWCOAST_121

Macrogroup: Californian-Vacouverian Foothill and Valley

Forest & Woodland

Group: Vancouverian Dry Douglas-fir-(Madrone) Forest and

Woodland

<u>Alliance</u>: Pseudotsuga menziesii-(Arbutus menziesii) Forest

and Woodland

Classification Confidence Level:

<u>Range</u>: This association occurs in the eastern and northeastern Olympic Mountains and the adjacent Puget Lowlands.

Plots: 3, MORA (0), NOCA (0), OLYM (3), Other (0)

<u>Environmental Description</u>: This association occurs at low to middle elevations in dry climatic areas within the Olympic Mountains' rainshadow. Aspects are more commonly south to west. The association occurs most frequently on soils that

are relatively shallow such as on glacial outwash, glacial till, other parent materials with high gravel or stone content, and/or on bedrock.

<u>Vegetation Description</u>: Stands are dominated by *Pseudotsuga menziesii* with little to no *Tsuga heterophylla* or *Thuja plicata*. *Arbutus menziesii* can be prominent. The understory is dominated by *Gaultheria shallon*. *Holodiscus discolor* can be abundant and is diagnostic in the Olympic Mountains. *Polystichum munitum* may be present, but always with under 5% cover. Other frequently occurring species are *Festuca occidentalis*, *Rosa gymnocarpa*, *Rubus ursinus*, and *Mahonia* (=Berberis) nervosa.

USFWS Wetland System: Not applicable.

<u>Comments</u>: In the Olympics, this type is distinguished from the *Pseudotsuga menziesii/Gaultheria shallon-Vaccinium parvifolium* association (PNWCOAST_124) by the prevalence of *Holodiscus discolor*.

Conservation Rank: S2

Rank Justification: Few occurrences of relatively good quality remain. Most examples have been altered by past timber harvest.

Synonyms:

Mixed Coniferous Forest; Rust 1992

Pseudotsuga menziesii/ Gaultheria shallon Community; Fonda and Bernardi 1976

Douglas-fir/Oceanspray-Baldhip Rose/Western Fescue Forest

Acronym: PSEMEN/HOLDIS-ROSGYM/FESOCC

NatureServe Code: CEGL000456

Macrogroup: Californian-Vacouverian Foothill and Valley

Forest & Woodland

Group: Vancouverian Dry Douglas-fir-(Madrone) Forest and

Woodland

Alliance: Pseudotsuga menziesii-(Arbutus menziesii) Forest

and Woodland

Classification Confidence Level: 1

Range: This association occurs primarily in the northeastern Olympic Mountains but also occurs in the western Cascadesand northern Puget Lowlands.

Cascacesaria normeni i aget Lowianas.

Plots: 18, MORA (1), NOCA (2), OLYM (15), Other (0)

<u>Environmental Description</u>: This association occurs at low to middle elevations on steep slopes or upper slope positions with southerly aspects. Sites have shallow or very rocky, well-drained soils. Topographic positions are dry.

Vegetation Description: This forest, or occasionally woodland, is dominated by *Pseudotsuga menziesii*. A variable-density tall-shrub layer (2-6 m tall) is usually present and is dominated by *Holodiscus discolor*. Occasionally *Acer circinatum* or *A. glabrum* is prominent. *Taxus brevifolia* can be abundant and character species may be sparsely represented in some examples of this association. Shorter shrubs are also variable in their cover and always include *Rosa gymnocarpa*. *Mahonia* (=Berberis) nervosa and *M. aquifolium* are usually present, the former sometimes co-dominant. *Symphoricarpos hesperius* (=mollis) is frequent and sometimes prominent in the Olympics. The herb layer is typically dominated by short grasses, especially *Festuca occidentalis*, *Festuca subuliflora*, and *Melica subulata*. Other frequent herbs include *Achlys (californica, triphylla)*, *Bromus vulgaris*, *Osmorhiza berteroi*, *Pteridium aquilinum*, *Rubus ursinus*, *Adenocaulon bicolor*, *Fragaria vesca*, *Linnaea borealis*, and *Trientalis borealis* ssp. *latifolia*. *Polystichum munitum* is frequently present but never prominent.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is similar to the preliminary *Pseudotsuga menziesiil Holodiscus discolorl Calamagrostis rubescens* association that contains species more common to the Rocky Mountain flora such as *Pinus ponderosa*, *Calamagrostis rubescens* and *Spiraea betulifolia*.

<u>Rank Justification</u>: This association has a restricted geographic range and relatively specific environmental range. Few occurrences not significantly altered by past timber harvest are known in the lowlands. Lower foothill occurrences are less disturbed and more abundant.

Pseudotsuga menziesii-(Abies grandis)/Acer circinatum/Paxistima myrsinites Forest

Douglas-fir-(Grand Fir)/Vine Maple-Oregon boxwood Forest

Acronym: PSEMEN-(ABIGRA)/ACECIR-PAXMYR

NatureServe Code: Provisional

<u>Macrogroup</u>: Northern Rocky Mountain Lower Montane and Foothill Forest

Group: East Cascades Mesic Montane Mixed-Conifer Forest and Woodland

Alliance: Abies grandis-Pseudotsuga menziesii Forest

Classification Confidence Level: 3

Range: This association is found at middle elevations in the east Cascades, mostly in and south of the Lake Chelan National Recreation Area.

Plots: 4, MORA (0), NOCA (2), OLYM (0), Other (2)

Environmental Description: This association is found at middle elevations. Sites are generally flat to moderately steep slopes on southerly aspects. Soils are wel-drained, often derived from glacial, alluvial or debris flow parent material.

<u>Vegetation Description</u>: Pseudotsuga menziesii typically dominates the canopy or co-dominates with Abies grandis. The abundance of Abies grandis is generally a function of stand age with abundance being higher in older forests. Abies grandis often occupies over 10% total cover and usually dominates tree regeneration. Pinus ponderosa or Acer macrophyllum are often present. A tall to medium-sized shrub layer is dominated by Acer circinatum with several other shrub species, usually Paxistima (=Pachistima) myrsinites, abundant with Rosa gymnocarpa, Spiraea betulifolia, Chimaphila

umbellata, Mahonia (=Berberis) nervosa and Vaccinium membranaceum frequently present. On moist sites, the herb layer is well developed and frequently includes Clintonia uniflora, Trillium ovatum, and Maianthemum (=Smilacina) stellatum. In dense stands, the herb layer is sparse or absent, however, Pteridium aquilinum or Goodyera oblongifolia are usually present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This is a provisional association that is similar to both the *Abies grandis/Acer circinatum* association as described on the Wenatchee National Forest and to the provisional *Pseudotsuga menziesii-(Tsuga heterphylla)/Acer circinatum/Paxistima myrsinites* association in this report. A broad regional analysis is needed to clarify relationships between these types.

Conservation Rank: S3Q

Rank Justification: This provisional association appears to have a narrow range in the east Cascades.

Synonyms:

Pseudotsuga menziesii-(Tsuga heterophylla)/Acer circinatum-Paxistima myrsinites Forest

Douglas-fir-(Western Hemlock)/Vine Maple-Oregon boxwood Forest

Acronym: PSEMEN-(TSUHET)/ACECIR-PAXMYR

NatureServe Code: Provisional

Macrogroup Northern Rocky Mountain Lower Montane and

Foothill Forest

Group: East Cascades Mesic Montane Mixed-Conifer

Forest and Woodland

Alliance: Abies grandis-Pseudotsuga menziesii Forest

Classification Confidence Level: 3

Range: This association occurs in the east Cascades, mostly in the Lake Chelan National Recreation Area and south to the Upper Wenatchee drainage.

south to the Opper Wenatchee drainage.

Plots: 3, MORA (0), NOCA (2), OLYM (0), Other (1)

<u>Environmental Description</u>: This association is found at middle elevations less than 1220 m (4000 ft). Sites are relatively warm toe slopes and benches, are located on all aspects and have well-watered but well-drained soil.

<u>Vegetation Description</u>: The canopy is typically co-

dominated by *Pseudotsuga menziesii* with *Tsuga heterophylla*, *Thuja plicata* and/or *Abies grandis* in the main canopy. The abundance of the latter three species is generally a function of stand age. *Pinus monticola* is often present. *Tsuga heterophylla* or *Thuja plicata* always occupy over 10% total cover and usually dominate tree regeneration. A tall-shrub layer is dominated by *Acer circinatum*. Several other shorter shrub species may be present such as *Paxistima* (=*Pachistima*) *myrsinites*, which is predominate, and *Mahonia* (=*Berberis*) *nervosa*, *Rosa gymnocarpa*, *Chimaphila umbellata*, *Linnaea borealis* and *Rubus parviflorus*, which occur less prominently. On moist sites the herb layer is well developed. *Clintonia uniflora*, *Asarum caudatum*, *Maianthemum* (=*Smilacina*) *stellatum* or *Goodyera oblongifolia* are usually present.

<u>Comments</u>: This association is similar to four stands in the North Cascades that have *Abies grandis* in the main canopy without *Tsuga heterophylla* or *Thuja plicata*. These stands are described as the provisional *Pseudotsuga menziesii-(Abies grandis)/Acer circinatum/Paxistima myrsinites* Forest. A similar association on the Wenatchee National Forest, *Tsuga heterophylla /Acer circinatum/Clintonia uniflora* association has less prominence of *Paxistima myrsinites*.

Conservation Rank: S3S4

Rank Justification: This association occurs in the east Cascades within a relatively narrow range.

Synonyms:

Tsuga heterophylla /Acer circinatum/Clintonia uniflora association; Lillybridge et al. 1995

Pseudotsuga menziesii/Mahonia nervosa/Calamagrostis rubescens Forest

Douglas-fir/Dwarf Oregongrape/Pinegrass Forest

Acronym: PSEMEN/MAHNER/CALRUB

NatureServe Code: Preliminary

Macrogroup: Northern Rocky Mountain Lower Montane and

Foothill Forest

Group: East Cascades Mesic Montane Mixed-Conifer

Forest and Woodland

Alliance: Pseudotsuga menziesii-(Tsuga heterophylla)-

Calamagrostis rubescens Woodland Classification Confidence Level: 3

 $\underline{\textbf{Range}} :$ This association occurs in the northeastern

Cascades.

Plots: 6, MORA (0), NOCA (5), OLYM (0), Other (1)

<u>Environmental Description</u>: This association occurs at low to middle elevations, typically on moderately steep and southerly slopes. Evidence of past fire is usually present.

<u>Vegetation Description</u>: The open to closed canopy is dominated by *Pseudotsuga menziesii*. When present, *Tsuga heterophylla* or *Thuja plicata* is never prominent. *Mahonia* (=Berberis) nervosa is typically prominent to dominant in the shrub layer. The tall shrub layer is generally sparse although *Acer circinatum*, *Acer glabrum*, *Holodiscus discolor*, *Lonicera ciliosa*, and/or *Corylus cornuta* may be present. *Spiraea betulifolia* (characteristic), *Mahonia aquifolium*, *Lonicera ciliosa*, *Paxistima* (=Pachistima) myrsinites and *Rosa gymnocarpa* are typical in the lower shrub layer. The herb layer is usually poorly developed. *Calamagrostis rubescens* (characteristic), *Elymus glaucus*, *Moehringia* (=Arenaria) macrophylla, *Trientalis borealis* and *Linnaea borealis* are frequently present. *Achlys (californica, triphylla)* is absent.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association has similarities with the *Abies grandis/Mahonia nervosal Calamagrostis rubescens* association on the Wenatchee National Forest (Lillybridge et al. 1995) although lacking the tree species in the name,. It is also similar to the east Cascades preliminary *Pseudotsuga menziesiil Mahonia nervosal Achlys triphylla* Forest association but lacks the differential species *Achlys (californica, triphylla)* and contains *Calamagrostis rubescens*, and *Spiraea betulifolia*.

Conservation Rank: S2S4

Rank Justification: As currently recognized, this preliminary association occurs in the northeastern Cascades and may occur in the east Cascades within a narrow geographic range.

Synonyms:

Pseudotsuga menziesii-Abies grandis/Calamagrostis rubescens Woodland

Douglas-fir-Grand Fir/Pinegrass Woodland

<u>Acronym</u>: PSEMEN-ABIGRA/CALRUB NatureServe Code: CEGL000916

<u>Macrogroup</u>: Northern Rocky Mountain Lower Montane and Foothill Forest <u>Group</u>: East Cascades Mesic Montane Mixed-Conifer Forest and Woodland <u>Alliance</u>: Pseudotsuga menziesii-(Tsuga heterophylla)-Calamagrostis rubescens

Woodland

Classification Confidence Level: 3

Range: This association occurs in the east Cascades, mostly south of the Lake

Chelan National Recreation Area.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

<u>Environmental Description</u>: This association is found at middle elevations on all aspects on flat to moderately steep slopes on deep, well-drained colluvial soils.

Vegetation Description: The woodland or forest canopy is typically co-dominated

by Abies grandis and Pseudotsuga menziesii with Pinus ponderosa present to prominent. Abies grandis always occupies over 10% total cover and usually dominates tree regeneration. A sparse, medium-sized shrub layer may be present and is usually comprised of Rosa gymnocarpa, Spiraea betulifolia, or Paxistima (=Pachistima) myrsinites. The herb layer is well developed and is dominated by Calamagrostis rubescens and often Carex geyeri. Arnica cordifolia or Moehringia (=Arenaria) macrophylla may be present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is not represented in the current dataset of vegetation plot data for national parks in Washington.

Conservation Rank: S4S5

<u>Rank Justification</u>: This association occurs in the east Cascades and the northern Rocky Mountains in a relative narrow ecological range. Fire suppression may have increased its local abundance and most of those stands are threatened by wildfire.

Synonyms:

Abies grandis / Calamagrostis rubescens; Lillybridge et al. 1995

Pinus contorta/Paxistima myrsinites/Calamagrostis rubescens Forest

Lodgepole Pine/Oregon boxwood/Pinegrass Forest

Acronym: PINCON/PAXMYR/CALRUB

NatureServe Code: Provisional

Macrogroup: Northern Rocky Mountain Lower Montane and

Foothill Forest

Group: Northern Rocky Mountain Douglas-fir-Pine Forest

Alliance: Pseudotsuga menziesii-(Pinus contorta var.

latifolia) Forest

Classification Confidence Level: 3

 $\underline{\textbf{Range}}\text{: This association is described from one plot sampled}$

in the North Cascades.

Plots: 1, MORA (0), NOCA (1), OLYM (0), Other (0)

Environmental Description: The plot defining this type occurs on a south-facing flat site at 890 m (2965 ft)

elevation.

<u>Vegetation Description</u>: *Pinus contorta* var. *latifolia* dominates the forest canopy with only trace amounts of

Pseudotsuga menziesii. The ground cover is patchy with Paxistima (=Pachistima) myrsinites prominent to dominant. Other shrubs such as Shepherdia canadensis, Mahonia (=Berberis) nervosa, and Vaccinium membranaceum are often present. Calamagrostis rubescens (indicator for this type), Chimaphila umbellata, Trientalis borealis ssp. latifolia and other herbaceous species occur in low abundance.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This provisional type is similar to the Northern Rocky Mountain *Pinus contortal Calamagrostis rubescens* association (CEGL000139) but with Cascadian species (*Acer circinatum, Mahonia nervosa*). We assume that all *Pinus contorta* at high elevation (over 1970ft, 600 m) is variety *latifolia*.

Conservation Rank: SU

Rank Justification: There is insufficient information to rank this provisional association.

Synonyms:

Pinus contorta/Vaccinium membranaceum Woodland

Lodgepole Pine/Big Huckleberry Woodland

<u>Acronym</u>: PINCON/VACMEM <u>NatureServe Code</u>: CEGL000169

Macrogroup: Northern Rocky Mountain Lower Montane and

Foothill Forest

<u>Group</u>: Northern Rocky Mountain Douglas-fir-Pine Forest <u>Alliance</u>: *Pseudotsuga menziesii-(Pinus contorta* var. *latifolia*) Forest

Classification Confidence Level: 3

Range: This association occurs in the North Cascades and likely occurs north into British Columbia and east into the Northern Rockies.

Plots: 2, MORA (0), NOCA (2), OLYM (0), Other (0)

<u>Environmental Description</u>: The association occurs on dry, rocky, and relatively flat sites. Current samples are from 870-950 m (2858-3123 ft) elevation.

<u>Vegetation Description</u>: These are open forests dominated by *Pinus contorta* var. *latifolia. Abies lasiocarpa* occurs in some locations although it is is never prominent and usually occurs below the main canopy. *Vaccinium membranaceum* and *Arctostaphylos nevadensis* dominate the patchy shrub layer. The abundance of *Arctostaphylos nevadensis* is inversely related to canopy density. *A. nevadensis* is replaced by *Vaccinium membranaceum* in more closed canopies. *Paxistima* (=Pachistima) *myrsinites* and *Amelanchier alnifolia* are frequently present. Although the herb layer is generally sparse, *Calamagrostis rubescens* can be abundant in some sites.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association, as sampled in North Cascades, is apparently a seral stage of the *Abies lasiocarpal Vaccinium membranaceum* association (CEGL000342). This expands the same concept as *Pinus contortal Vaccinium membranaceum* Rocky Mountain Forest rather than the *Pinus contortal Vaccinium membranaceum* Forest (CEGL000170) which occurs at lower elevation or is more associated with or seral to *Abies grandis* or *Pseudotsuga menziesii* forests in the east Cascades. We assume that all *Pinus contorta* at high elevation (over 1970ft, 600 m) is variety *latifolia*.

Conservation Rank: S4Q

Rank Justification: This association is relatively common in the east Cascades and Rocky Mountains. It is fire dependent.

Synonyms:

Pinus contorta (Abies Iasiocarpa)/Vaccinium membranaceum Community; Johnson & Clausnitzer 1992 Pinus contorta (Abies Iasiocarpa)/Vaccinium membranaceum/Calamagrostis rubescens Community; Johnson & Clausnitzer 1992

Pseudotsuga menziesii-(Pinus contorta)/Vaccinium myrtillus Woodland

Douglas-fir-(Lodgepole Pine)/ Bilberry Woodland

Acronym: PSEMEN-(PINCON)/VACMYR

NatureServe Code: Provisional

Macrogroup: Northern Rocky Mountain Lower Montane and Foothill Forest

Group: Northern Rocky Mountain Douglas-fir-Pine Forest

Alliance: Pseudotsuga menziesii-(Pinus contorta var. latifolia) Forest

Classification Confidence Level:

Range: This association occurs in the northeastern Cascades in Washington and

adjacent British Columbia.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This cool, usually steep sloped, montane woodland association occurs in an elevation range from 910 to 1500 m (3000-5000+ ft). Stands occur on cool sites on mid to upper slopes on southerly aspects.

<u>Vegetation Description</u>: The typically open tree canopy is dominated by

Pseudotsuga menziesii usually with Pinus contorta although Larix occidentalis, Pinus monticola or Pinus ponderosa may also be present. A short shrub layer is dominated by Vaccinium myrtillus with Paxistima (=Pachistima) myrsinites, Spiraea betulifolia, Arctostaphylos uva-ursi and/or Vaccinium membranaceum frequently present. Calamagrostis rubescens occurs in most sites and can be dominant on more moderate sites with deeper soil.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is not represented in the current dataset of vegetation plots for national parks in Washington. This association similar to the *Pseudotsuga menziesiil Vaccinium caespitosum* in Northern Rockies (CEGL000465). A regionwide evaluation is need to clarify this relationship.

Conservation Rank: S3S4

Rank Justification: This association is relatively widespread in the mountains of eastern Washington but occupies small areas.

Synonyms:

Pseudotsuga menziesiil Vaccinium myrtillus association; Lillybridge et al. 1995 Pseudotsuga menziesiil Vaccinium myrtillus/Calamagrostis rubescens association; Lillybridge et al. 1995 Pseudotsuga menziesii-(Pinus contorta)/ Vaccinium myrtillus Woodland; Chappell 2005 NPK

Photo Not Available

Pseudotsuga menziesii/Vaccinium caespitosum Forest

Douglas-fir/Dwarf Huckleberry Forest

Acronym: PSEMEN/VACCAE
NatureServe Code: CEGL000465

Macrogroup: Northern Rocky Mountain Lower Montane and

Foothill Forest

<u>Group</u>: Northern Rocky Mountain Douglas-fir-Pine Forest <u>Alliance</u>: *Pseudotsuga menziesii-(Pinus contorta* var. *latifolia*) Forest

Classification Confidence Level: 2

Range: This association occurs in the eastern North Cascades and the Northern Rocky Mountains.

Plots: 1, MORA (0), NOCA (1), OLYM (0), Other (0)

Environmental Description: This association appears on gentle slopes and in cold air drainages typically on glacial outwash. It occurs between 700 and 1350 m (2300-4420 ft) elevation in the Northern Rockies. The plot sampled in the parks occurred on a small rocky terrace at 620 m (2037 ft) elevation on a 15% slope.

<u>Vegetation Description</u>: The canopy is dominated by *Pinus contorta var.* latifolia or co-dominated by that species and *Pseudotsuga menziesii. Vaccinium caespitosum* occurs present to prominent with *Arctostaphylos uva-ursi, Paxistima* (=Pachistima) myrsinites, *Spiraea betulifolia* and *Vaccinium membranaceum*. The herb layer can be sparse to proiminent with *Calamagrostis rubescens* almost always present and often the dominant species. However the ground layer can be well-developed and often dominated by mosses such as *Pleurozium schreberi* and *Hylocomium splendens*.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs in the northeastern Cascades and in the east Cascades within a narrow geographic range.

Foothill Forest

<u>Group</u>: Northern Rocky Mountain Douglas-fir-Pine Forest <u>Alliance</u>: *Pseudotsuga menziesii-(Pinus contorta* var. *latifolia*) Forest

Classification Confidence Level: 3

<u>Range</u>: This association occurs in the east Cascade Mountains and the Northern Rocky Mountains.

Plots: 5, MORA (0), NOCA (5), OLYM (0), Other (0)

Environmental Description: This association occurs from 850-975 m (2800-3200 ft) elevation on any aspect and typically located on drier topographic positions. Slopes are moderately steep to steep (12-60%). Soils are well-drained

<u>Vegetation Description</u>: These tall forests are dominated

by Pseudotsuga menziesii. Pinus monticola or Pinus contorta are often present in the subcanopy. Abies amabilis, Abies lasiocarpa or Tsuga heterophylla are also often present but never prominent. The understory is relatively open and is dominated by Vaccinium membranaceum. Paxistima (=Pachistima) myrsinites can be co-dominant. Other shrubs that may be present include Amelanchier alnifolia, Spiraea betulifolia, Acer glabrum, and Sorbus scopulina. Calamagrostis rubescens is the most common graminoid and most abundant species in the herb layer. Other species include Arnica cordifolia, Lilium columbianum, Rubus lasiococcus and Goodyera oblongifolia.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is similar to the *Pseudotsuga menziesiil Vaccinium membranaceum* association (CEGL000466) as described in the northern Rockies but with Cascadian species (*Abies amabilis, Mahonia (=Berberis) nervosa,* and *Pseudotsuga menziesii* presumably var. *menziesii*). It is tentatively considered part of that association pending better regionwide analysis.

Conservation Rank: S3S5Q

<u>Rank Justification</u>: This association occurs in the northeastern Cascades and northern Rocky Mountains where it is relatively abundant. As defined here, it may occur only in the northeastern Cascades of Washington and adjacent British Columbia.

NatureServe Code: Preliminary

Macrogroup: Northern Rocky Mountain Lower Montane and Foothill Forest

Group: Northern Rocky Mountain Douglas-fir-Pine Forest

Alliance: Pseudotsuga menziesii-(Pinus contorta var. latifolia) Forest

Classification Confidence Level: 3

Range: This association occurs in the east Cascades, mostly in the Lake Chelan

National Recreation Area and southward.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This association is found at middle elevations on very rocky sites with a relatively mild climate. They are located on all aspects.

<u>Vegetation Description</u>: The canopy is always open and is composed of slow growing trees. Stands are usually co-dominated by *Pseudotsuga menziesii* and

Pinus contorta with Tsuga heterophylla frequently in the main canopy, its abundance generally a function of stand age. Pinus monticola may be present. A low shrub layer is dominated by Arctostaphylos nevadensis typically with several other short shrub species, including Vaccinium membranaceum, Paxistima (=Pachistima) myrsinites, Chimaphila umbellata, and Spiraea betulifolia. The herb layer is inconspicuous although patches of Pteridium aquifolium, Calamagrostis rubescens or Hieracium albiflorum may be present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is not represented in the current data for national parks in Washington. This type may be a variation of *Tsuga heterophyllal Arctostaphylos nevadensis* association (CEGL000913) described by Lillybridge (1995) on the Wenatchee National Forest.

Conservation Rank: S2S3

Rank Justification: This association occurs in the east Cascades within a relatively narrow geographic range.

Synonyms:

Tsuga heterophylla/Arctostaphylos nevadensis association; Lillybridge et al. 1995 Pseudotsuga menziesii-Pinus contorta/Arctostaphylos nevadensis Woodland; Chappell 2005 NPK

Pseudotsuga menziesii-(Pinus ponderosa)/Symphoricarpos albus Forest

Douglas-fir-(Ponderosa Pine)/Common Snowberry Forest

Acronym: PSEMEN-(PINPON)/SYMALB

NatureServe Code: Provisional

Macrogroup: Northern Rocky Mountain Lower Montane and

Foothill Forest

<u>Group</u>: Northern Rocky Mountain Douglas-fir-Pine Forest Alliance: *Pseudotsuga menziesii-(Pinus ponderosa)* Forest

Classification Confidence Level: 2

<u>Range</u>: This association occurs north of Wenatchee in the east Cascades and in the Okanogan Highlands.

Plots: 3, MORA (0), NOCA (2), OLYM (0), Other (1)

<u>Environmental Description</u>: This association is found in the mid to lower elevation range. Sites vary from moderately steep slopes to flat, dry terraces near streams. Aspects vary from north to southeast.

<u>Vegetation Description</u>: The forest or woodland canopy is

typically dominated by *Pseudotsuga menziesii* and often by *Pinus ponderosa*. Scattered tall shrubs, such as, *Amelanchier alnifolia, Acer glabrum* or *Holodiscus discolor* may be present. *Symphoricarpos albus* dominates the mid-sized shrub layer, with scattered *Spiraea betulifolia, Paxistima (=Pachistima) myrsinites, Mahonia (=Berberis) aquilifolium* or *M. repens* also present. The herb layer is sparse but diverse and it often includes low cover of *Arnica cordifolia, Osmorhiza berteroi (=chilensis), Elymus glaucus* or *Calamagrostis rubescens*. In sites where shrubs have been reduced because of a dense tree canopy, grazing, or repeated fire, *Calamagrostis rubescens* is dominant to co-dominant with *Symphoricarpos albus*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is similar to or the same as the *Pseudotsuga menziesii / Symphoricarpos albus* forest (CEGL000459). It may occur near Lake Chelan. A regionwide evaluation is need to clarify this relationship.

Conservation Rank: S4

Rank Justification: This widespread, montane forest association occurs in the east Cascades and northern Rocky Mountains. Logging has removed many large trees from many stands and has lowered the overall condition of the type.

Synonyms:

Pseudotsuga menziesii/Symphoricarpos albus Association; Williams and Lillybridge 1983, Lillybridge et al. 1995, Johnson & Clausnitzer 1992, Williams et al. 1995

Pseudotsuga menziesii/Holodiscus discolor/Calamagrostis rubescens Forest

Douglas-fir/Oceanspray/Pinegrass Forest

Acronym: PSEMEN/HOLDIS/CALRUB

NatureServe Code: Preliminary

Macrogroup: Northern Rocky Mountain Lower Montane and

Foothill Forest

<u>Group</u>: Northern Rocky Mountain Douglas-fir-Pine Forest <u>Alliance</u>: *Pseudotsuga menziesii-(Pinus ponderosa)* Forest

Classification Confidence Level: 3

Range: This association occurs in the northeastern

Cascade Mountains.

Plots: 4, MORA (0), NOCA (3), OLYM (0), Other (1)

Environmental Description: This association was sampled between 580 and 795 m (1900 and 2600 ft) elevation on relatively steep slopes. Sites are in dry topographic positions. The ground contains frequent rocky fragments and is typically moss covered.

<u>Vegetation Description</u>: This forest, or often woodland, is dominated by *Pseudotsuga menziesii*. A tall-shrub layer is usually present in canopy openings and can vary in density. It is dominated by *Holodiscus discolor*, *Acer glabrum* and *Amelanchier alnifolia*. Shorter shrubs are also variable in their cover and usually include *Spiraea betulifolia*, *Paxistima* (=*Pachistima*) *myrsinites*, *Mahonia aquifolium* and *Rosa gymnocarpa*. *Arctostaphylos uva-ursi* and *Lonicera ciliosa* can be prominent. The herb layer contains *Calamagrostis rubescens*, *Arnica cordifolia*, *Fragaria virginiana*, *Trientalis borealis* and *Linnaea borealis*. Mosses such as *Hylocomium splendens* and *Rhytidiadelphus triquetrus* can dominate the ground layer.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This preliminary association may be the same as the *Pseudotsuga menziesii/Holodiscus discolor/Carex geyeri* association (CEGL000437) found further south in the east Cascades. It is also similar to the *Pseudotsuga menziesii/Holodiscus discolor-Rosa gymnocarpa/Festuca occidentalis* Forest (CEGL000456) but with east Cascades/ Rocky Mountain floristic elements. Further regional analysis is needed clarify relationships among these associations.

Conservation Rank: S3S4Q

Rank Justification: As currently recognized, this preliminary association occurs within a narrow geographic range.

Synonyms:

Pinus ponderosa-Pseudotsuga menziesii/Purshia tridentata Woodland

Ponderosa Pine-Douglas-fir/Bitterbrush Woodland

<u>Acronym</u>: PINPON-PSEMEN/PURTRI <u>NatureServe Code</u>: CEGL000214

Macrogroup: Northern Rocky Mountain Lower Montane and Foothill Forest

<u>Group</u>: Northern Rocky Mountain Douglas-fir-Pine Forest <u>Alliance</u>: *Pseudotsuga menziesii-(Pinus ponderosa)* Forest

Classification Confidence Level: 2

Range: This association occurs in the east Cascades of Washington and British Columbia, and south into Oregon. This type may occur on south aspects near Lake Chelan.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This low to mid-elevation woodland occurs within an elevational range of 760 to 1220 m (2500-4000 ft). Stands occur on hot, dry slopes of varying steepness and on southerly aspects. Surface rocks are usually high to moderate in abundance.

<u>Vegetation Description</u>: The typically open tree canopy is co-dominated by *Pseudotsuga menziesii* and *Pinus ponderosa*. Other tree species rarely appear in these stands. An open to dense shrub layer of consisting nearly exclusively of *Purshia tridentata* forms the understory. Other deciduous shrub speces can occur in low abundance. *Amelanchier alnifolia* is the most frequent of these deciduous shrubs. A moderately dense (10-60% cover) to sparse perennial graminoid layer is typically dominated by *Pseudoroegneria* (=*Agropyron*) *spicata*. *Festuca idahoensis* or *Calamagrostis rubescens* may also occur. Forb diversity is low. Common forb species include *Achillea millefolium*, *Balsamorhiza sagittata*, and *Lupinus sericeus*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is not represented in the current dataset of vegetation plot data for national parks in Washington. It could occur above Lake Chelan.

Conservation Rank: S3

Rank Justification: This association is widespread in the foothills of the east Cascades. Logging of large trees and exotic plant invasion are major threats.

Synonyms:

Pinus ponderosa-Pseudotsuga menziesii/Purshia tridentata Woodland; Chappell 2005 NPK Pseudotsuga menziesii/Purshia tridentata Association; Lillybridge et al. 1995 Pseudotsuga menziesii/Purshia tridentata/Agropyron spicatum Association; Lillybridge et al. 1995 Pseudotsuga menziesii/Purshia tridentata/Calamagrostis rubescens Association; Lillybridge et al. 1995 Pseudotsuga menziesii-Pinus ponderosa/Purshia tridentata Community; Williams and Smith 1990

Douglas-fir/Oregon boxwood-White Spirea Woodland

Acronym: PSEMEN/PAXMYR-SPIBET

NatureServe Code: Preliminary

Macrogroup: Northern Rocky Mountain Lower Montane and

Foothill Forest

<u>Group</u>: Northern Rocky Mountain Douglas-fir-Pine Forest <u>Alliance</u>: *Pseudotsuga menziesii-(Pinus ponderosa*) Forest

Classification Confidence Level: 3

Range: This association occurs in the northeastern Cascades in Washington and adjacent British Columbia.

Plots: 1, MORA (0), NOCA (1), OLYM (0), Other (0)

Environmental Description: This montane woodland occurs at elevations ranging from 1200 to 1600 m (4000-5200 ft). Stands occur on cool, dry sites on mid to upper slopes with southerly aspects. Evidence of past fires is usually present.

<u>Vegetation Description</u>: The typically open tree canopy is dominated by *Pseudotsuga menziesii* although *Pinus ponderosa* or *Pinus contorta* may be abundant in the canopy. *Paxistima* (=Pachistima) myrsinites is the most dominant shrub commonly occuring with scattered individuals of other species such as *Acer glabrum*, *Amelanchier alnifolia*, *Mahonia aquifolium*, *Lonicera ciliosa*, *Rosa gymnocarpa* or *Spiraea betulifolia*. *Calamagrostis rubescens* occurs in most sites but is rarely more than prominent.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This type is the *Pseudotsuga menziesiil Paxistima myrsinites* association on the Wenatchee National Forest. One plot in the North Cascades appears in the tables as PINPON-PSEMEN/PAXMYR-ARCUVA and is interpreted to be a variant of this association.

Conservation Rank: S3S4

<u>Rank Justification</u>: This association is relatively common within a narrow geographic range. Current ecological condition and threats to existing occurrences are unknown.

Synonyms:

Pseudotsuga menziesii/Paxistima myrsinites association; Williams and Lillybridge 1983, Lillybridge et al. 1995 Pseudotsuga menziesii/Paxistima myrsinites/Calamagrostis rubescens Woodland; Chappell 2005 NPK

Pseudotsuga menziesii-Pinus ponderosa/Arctostaphylos nevadensis Woodland

Douglas-fir-Ponderosa Pine/Pinemat Manzanita Woodland

Acronym: PSEMEN-PINPON/ARCNEV

NatureServe Code: Preliminary

Macrogroup: Northern Rocky Mountain Lower Montane and

Foothill Forest

<u>Group</u>: Northern Rocky Mountain Douglas-fir-Pine Forest <u>Alliance</u>: *Pseudotsuga menziesii-(Pinus ponderosa)* Forest

Classification Confidence Level: 3

Range: This association occurs in the east Cascades.

Plots: 4, MORA (0), NOCA (4), OLYM (0), Other (0)

<u>Environmental Description</u>: This association is found on steep slopes, ridgelines, and rocky sites. It can be associated with glacial outwash or till in cold-air drainages often with rocks exposed

<u>Vegetation Description</u>: The canopy is always open and is typically co-dominated by *Pseudotsuga menziesii* and *Pinus*

ponderosa. Abies grandis or Pinus contorta var. latifolia can be present to prominent in some stands. The understory is open. A low shrub layer is dominated by Arctostaphylos nevadensis typically with several other short growing shrub species such as Paxistima (=Pachistima) myrsinites and Spiraea betulifolia present. The moderate to dense herb layer features patches of Calamagrostis rubescens, Carex geyeri and Festuca occidentalis. Arnica cordifolia, Hieracium scouleri, Heuchera cylindrica, and Cryptogramma acrostichoides (=crispa) may be present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Ecologists in southwestern Oregon and adjacent California recognize the *Pinus ponderosa - Pseudotsuga menziesii | Arctostaphylos nevadensis* Woodland (CEGL000208). That association appears to be part of the variation described in *Abies grandis|Arctostaphylos nevadensis* on the Wenatchee National Forest and on the Yakama Reservation. All of those are equivalent to *Pseudotsuga menziesii-(Abies grandis)|Arctostaphylos nevadensis* (CEGL000915). The relationship among these associations and the one described here has yet to be resolved regionally.

Conservation Rank: S2

<u>Rank Justification</u>: This community is restricted to the east Cascades of Washington. This is a mid- to late-seral woodland that depends upon a relatively specific topography or parent material. Individual sites are small, and there are few representative stands throughout the community's range.

Synonyms:

Abies grandis/Arctostaphylos nevadensis; Lillybridge et al. 1995, John et al. 1988

Pseudotsuga menziesii-Pinus ponderosa/Calamagrostis rubescens Forest

Douglas-fir-Ponderosa Pine/Pinegrass Forest

Acronym: PSEMEN-PINPON/CALRUB

NatureServe Code: Preliminary

Macrogroup: Northern Rocky Mountain Lower Montane and Foothill Forest

<u>Group</u>: Northern Rocky Mountain Douglas-fir-Pine Forest <u>Alliance</u>: *Pseudotsuga menziesii-(Pinus ponderosa)* Forest

Classification Confidence Level: 2

Range: This association occurs in the east Cascades and in the Okanogan

Highlands.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This association occurs at low to mid-montane elevations (825 to 2400 m (2700-7900 ft)). Stands occur on cool, dry sites on mid to upper slopes and benches on all aspects. At the lowest elevations, stands are restricted to north aspects, and at upper elevations stands are found on warm and

dry southerly exposures. Substrates are variable (sandy to clayey), but are generally well-drained, coarser-textured, gravelly soils and derived from a variety of non-calcareous, acidic, parent materials. Surface rock usually is low to moderate, and litter cover is usually high.

<u>Vegetation Description</u>: The typically open tree canopy is dominated by *Pseudotsuga menziesii* or co-dominated by that species and *Pinus ponderosa. Larix occidentalis* or *Pinus contorta* trees may be present in the upper tree canopy. *Pseudotsuga menziesii* comprises the subcanopy. The scattered dwarf-shrubs *Arctostaphylos uva-ursi, Paxistima myrsinites* or *Spiraea betulifolia* may be present but less abundant than graminoids. The dense to moderately dense (20-60% cover) perennial graminoid layer characteristically dominates the understory. *Calamagrostis rubescens* typically is the dominant. Forbs are often diverse, but typically all have low cover. The most common forb species are *Achillea millefolium, Antennaria* spp., and *Arnica cordifolia*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is similar to the *Pseudotsuga menziesii | Calamagrostis rubescens* forest (CEGL000429) that may occur near Lake Chelan. A regional assessment is needed to clarify this relationship. This type is not currently represented in the dataset of vegetation plots from the national parks.

Conservation Rank: S5

Rank Justification: This widespread, montane forest association occurs in the east Cascades and northern Rocky Mountains. Large trees have been removed from many stands and have lowered the overall condition of the type.

Synonyms:

Pseudotsuga menziesii/Calamagrostis rubescens Association; Daubenmire & Daubenmire 1968, Williams and Lillybridge 1983, Lillybridge et al. 1995, Johnson & Clausnitzer 1992, Williams et al. 1995; John et al. 1988 Pseudotsuga menziesii-Pinus ponderosal Calamagrostis rubescens Forest; Chappell 2005 NPK Pseudotsuga menziesii/Calamagrostis rubescens Association Calamagrostis rubescens Phase; Cooper et al 1987

<u>Acronym</u>: PINPON/PSESPI <u>NatureServe Code</u>: CEGL000865

<u>Macrogroup</u>: Northern Rocky Mountain Lower Montane and Foothill Forest <u>Group</u>: Northern Rocky Mountain Ponderosa Pine Woodland and Savanna <u>Alliance</u>: Pinus ponderosa-(Pseudotsuga menziesii) Woodland and Savanna

Classification Confidence Level: 1

<u>Range</u>: This association may occur in the east Cascades but is more common near lower treeline in the Northern Rockies.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This low to mid-elevation woodland association occurs at 760 to 1220 m (2500-4000 ft). Stands occur on hot, dry sites on southfacing aspects. Surface rocks are highly abundant.

<u>Vegetation Description</u>: The typically open tree canopy is dominated by *Pinus*

ponderosa. Sites are generally too severe for *Pseudotsuga menziesii*. Shrubs are nearly absent. A moderately dense to sparse (20-60% cover) perennial graminoid layer dominated by *Pseudoroegneria* (=Agropyron) spicata forms the understory. Festuca idahoensis, Koeleria macrantha (=cristata), or Poa secunda (=sandbergii) may occur. The annual exotic grass *Bromus tectorum* is often present to abundant. Diversity of forbs is moderate. Common forb species include *Achillea millefolium*, *Balsamorhiza sagittata*, and *Lupinus* spp.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is not represented in the current dataset of vegetatin plot data for national parks in Washington. It could occur above Lake Chelan.

Conservation Rank: S1

<u>Rank Justification</u>: The association is widespread in eastern Washington but greatly reduced from it original distribution by the effects of fire suppression, timber harvesting of large trees and exotic plant invasion.

Synonyms:

Pinus ponderosa/Agropyron spicatum Association; Clausnitzer & Zamora 1987, Johnson & Clausnitzer 1992, Lillybridge et al. 1995

Pinus ponderosa/Pseudoroegneria spicata Woodland; Chappell 2005 NPK

Pinus albicaulis-(Abies lasiocarpa)/Vaccinium scoparium-Luzula glabrata var. hitchcockii Woodland

White-bark Pine-(Subalpine Fir)/Red Huckleberry/Hitchcock's Smooth Woodrush Woodland

Acronym: PINALB-(ABILAS)/VACSCO/LUZGLA

NatureServe Code: CEGL005839

Macrogroup: Rocky Mountain Subalpine & High Montane Conifer Forest

Group: Northern Rocky Mountain Whitebark-Limber Pine Woodland

Alliance: Abies lasiocarpa-Pinus albicaulis Woodland

Classification Confidence Level: 2

Range: This association occurs in the Cascade Mountains.

Plots: 2, MORA (0), NOCA (2), OLYM (0), Other (0)

Environmental Description: This association occurs near upper treeline. Sites are generally on moderate to steep slopes with north to southeast aspects.

<u>Vegetation Description</u>: The vegetation consists of tree islands in subalpine parklands. *Pinus albicaulis* typically dominates the three canopy or co-dominates with *Abies lasiocarpa*. The latter is usually present and has short-statured trees under the main canopy that can contribute greater overall cover than *Pinus albicaulis*. The understory vegetation is low in diversity with a short shrub layer of *Vaccinium scoparium* and/or *V. myrtillus*. A well-developed herb layer dominated by *Luzula glabrata* var. *hitchcockii* occurs in sites where snow accumulates and lingers into the growing season. Other sites or parts of sites lack *Luzula glabrata* var. *hitchcockii* and have only the short shrub layer, reflecting drier conditions.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Abies lasiocarpa is more abundant in plots from the North Cascades and falls within the concept of this association as it occurs in the Rocky Mountains. One plot contains high cover of *Ledum glandulosum* which is floristically similar to the riparian *Abies lasiocarpa / Ledum glandulosum* association (CEGL000314).

Conservation Rank: S2

<u>Rank Justification</u>: This somewhat widespread but unevenly distributed association occurs as isolated stands within the east Cascades and Okanogan Highlands. The ecological condition of occurrences is declining due to *Pinus albicaulis* mortality from fire exclusion and white pine blister rust (*Cronartium ribicola*).

Synonyms:

Pinus albicaulis/Vaccinium scoparium)/Luzula hitchcockii; Lillybridge et al. 1995

Pinus albicaulis-(Tsuga mertensiana)/Luzula glabrata var. hitchcockii Woodland

Alliance: Abies lasiocarpa-Pinus albicaulis Woodland

Classification Confidence Level: 2

Range: This association may occur at Mount Rainier National Park, in the North Cascades or in the northeast Olympic Mountains.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

<u>Environmental Description</u>: This association occurs at high elevations. Sites are

generally on northerly aspects near upper treeline.

<u>Vegetation Description</u>: The vegetation consists of tree islands or ribbons within subalpine parkland. The tree canopy is dominated by *Tsuga mertensiana*, *Abies*

amabilis, and/or *Pinus albicaulis*. The latter is always present and typically at least prominent. A shrub layer is largely absent. The well-developed herb layer usually has *Luzula glabrata* var. *hitchcockii*, *Arnica latifolia*, *Lupinus (arcticus ssp. subalpinus, latifolius)*, and *Polemonium pulcherrimum*. *Luzula glabrata* var. *hitchcockii* is prominent to dominant. A number of other species can co-dominate in some locations.

USFWS Wetland System: Not applicable.

Comments: This association is not represented in the current dataset of vegetation plots for national parks in Washington.

Conservation Rank: S1S2

Rank Justification: This somewhat widespread but unevenly distributed association occurs as isolated stands within the east Cascades. The ecological condition of occurrences is declining due to *Pinus albicaulis* mortality from fire exclusion and white pine blister rust (*Cronartium ribicola*).

Synonyms:

Pinus albicaulis/Calamagrostis rubescens Woodland

White-bark Pine/Pinegrass Woodland

Acronym: PINALB/CALRUB
NatureServe Code: CEGL000753

<u>Macrogroup</u>: Rocky Mountain Subalpine & High Montane Conifer Forest <u>Group</u>: Northern Rocky Mountain Whitebark-Limber Pine Woodland

Alliance: Abies lasiocarpa-Pinus albicaulis Woodland

Classification Confidence Level: 1

Range: This association occurs in the eastern North Cascades at high elevations.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

<u>Environmental Description</u>: Sites are south-facing slopes with relatively well-developed soils at subalpine elevations 1730-1980 m (5700-6500 ft). Sites characteristically have little snow accumulation due to high winds and sublimation.

<u>Vegetation Description</u>: The vegetation is either open woodlands or tree islands in subalpine parkland. The tree canopy is dominated by *Pinus albicaulis. Abies*

lasiocarpa is often present particularly in stands with taller trees. Pseudotsuga menziesii or Pinus contorta are occasionally present. A sparse, low-growing shrub layer may be present usually with Paxistima (=Pachistima) myrsinites, Vaccinium scoparium or V. myrtillus. The herb layer is moderate to well-developed in cover and is dominated or co-dominated by Calamagrostis rubescens or Carex geyeri. Achillea millefolium is usually present; other species are inconsistent.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is not represented in the current dataset of vegetation plots for national parks in Washington.

Conservation Rank: S2

Rank Justification: This community is widely distributed but restricted to the high elevations of the eastern Cascades in northern Washington. It occupies a relatively small acreage. The ecological condition of occurrences is declining due to *Pinus albicaulis* mortality from fire exclusion and white pine blister rust (*Cronartium ribicola*). As a result, this type is becoming increasingly rare.

White-bark Pine/Common Juniper Woodland

Acronym: PINALB/JUNCOM

NatureServe Code: PNWCOAST_091

Macrogroup: Rocky Mountain Subalpine & High Montane

Conifer Forest

Group: Northern Rocky Mountain Whitebark-Limber Pine

Woodland

Alliance: Abies lasiocarpa-Pinus albicaulis Woodland

Classification Confidence Level: 2

Range: This association occurs in the east Cascades and possibly on the northeast side of Mount Rainier or in the northeastern Olympic Mountains.

Plots: 1, MORA (0), NOCA (0), OLYM (0), Other (1)

<u>Environmental Description</u>: This association occurs at high elevations on generally steep, south-facing slopes with shallow or very rocky soils.

Vegetation Description: The vegetation occurs as either

open woodlands or tree islands in subalpine parkland. The tree canopy is dominated or co-dominated by *Pinus albicaulis*. *Abies lasiocarpa* is often prominent to co-dominant and *Tsuga mertensiana* is occasionally prominent to co-dominant. The low-growing shrub layer is typically well-developed and always dominated by *Juniperus communis*. *Paxistima* (=*Pachistima*) *myrsinites* is occasionally prominent to co-dominant. The herb layer is sparse to at most moderate in cover. *Achillea millefolium* is usually present; other species are inconsistent.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is not represented in the current dataset of vegetation plots for national parks in Washington. This community, as it occurs in the Cascades, is likely the same as the *Abies lasiocarpa* var. *lasiocarpa - Pinus albicaulis / Juniperus communis* association (CEGL002326) recognized in British Columbia.

Conservation Rank: S2?

<u>Rank Justification</u>: This community is widely distributed but restricted to the high elevations of the eastern Cascades in northern Washington. It occupies a relatively small acreage. The ecological condition of occurrences is declining due to *Pinus albicaulis* mortality from fire exclusion and white pine blister rust (*Cronartium ribicola*). As result this type is increasingly rare.

Larix Iyallii/Cassiope mertensiana-Luetkea pectinata Woodland

Subalpine Larch/White Mountain Heather-Partridgefoot Woodland

Acronym: LARLYA/CASMER-LUEPEC

NatureServe Code: Preliminary

Macrogroup: Rocky Mountain Subalpine & High Montane

Conifer Forest

Group: Northern Rocky Mountain Whitebark-Limber Pine

Woodland

<u>Alliance</u>: Larix lyallii-(Abies lasiocarpa, Picea engelmannii)

Woodland

Classification Confidence Level: 2

Range: This association occurs primarily in the east Cascades from Mount Stuart north to near the British Columbia border.

Plots: 3, MORA (0), NOCA (2), OLYM (0), Other (1)

Environmental Description: This subalpine woodland association occurs above continuous forest and below upper treeline. Its typical form is scattered to clustered patches of

trees across slopes to ridges. Sites are harsh, wind-swept, and with deep, lingering snowpacks.

<u>Vegetation Description</u>: The open tree canopy is usually dominated or co-dominated by *Larix Iyallii* with *Abies Iasiocarpa* and/or *Picea engelmannii* often present. *Pinus albicaulis* is absent or low in cover. The most prominent component of the understory is a layer of dwarf-shrubs,including *Luetkea pectinata*, *Cassiope mertensiana* and *Phyllodoce empetriformis*. Herbaceous plants are present but not prominent, typically represented by *Luzula glabrata* var. *hitchcockii*, *Carex nigricans* and *Valeriana sitchensis*.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S2S3

<u>Rank Justification</u>: This preliminary association occurs within a narrow environmental range although with few threats. Climate change will likely affect this vegetation.

Larix Iyallii/Vaccinium deliciosum Woodland

Subalpine Larch/Blueleaf Huckleberry Woodland

Acronym: LARLYA/VACDEL
NatureServe Code: CEGL000952

<u>Macrogroup</u>: Rocky Mountain Subalpine & High Montane Conifer Forest <u>Group</u>: Northern Rocky Mountain Whitebark-Limber Pine Woodland <u>Alliance</u>: Larix Iyallii-(Abies Iasiocarpa, Picea engelmannii) Woodland

Classification Confidence Level: 2

 $\underline{\textbf{Range}} : \textbf{This association occurs primarily in the east Cascades from Mount}$

Stuart to near the British Columbia border.

Plots: 3, MORA (0), NOCA (3), OLYM (0), Other (0)

Environmental Description: This subalpine woodland association occurs above continuous forest and below upper treeline. It tends to occur at a higher elevation (over 2285 m (7500 ft)) and with deeper snowpacks than Larix Iyallii / Cassiope mertensiana-Luetkea pectinata (Preliminary) sites.

<u>Vegetation Description</u>: This association forms scattered to clustered patches of trees across slopes to ridges. The open tree canopy is usually dominated by *Larix Iyallii* with *Abies Iasiocarpa* often present to codominant. *Pinus albicaulis* is absent or low in cover. The well-developed dwarf-shrub layer is co-dominated by *Vaccinium deliciosum Cassiope mertensiana*, *Luetkea pectinata* and/or *Phyllodoce empetriformis*. *Vaccinium scoparium* is often present. Herbaceous plants *Luzula glabrata* var. *hitchcockii*, *Carex nigricans* and *Valeriana sitchensis* are common and can be prominent.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S3

<u>Rank Justification</u>: This association is restricted narrowly along the Cascades. Climate change will likely affect this vegetation.

Synonyms:

Larix Iyalliil Vaccinium deliciosum Woodland; Chappell 2005 NPK Larix Iyalliil Vaccinium deliciosum-Cassiope mertensiana Association; Lillybridge et al. 1995

Subalpine Larch/Hitchcock's Smooth Woodrush Woodland

<u>Acronym</u>: LARLYA/LUZGLA <u>NatureServe Code</u>: CEGL000951

Macrogroup: Rocky Mountain Subalpine & High Montane

Conifer Forest

Group: Northern Rocky Mountain Whitebark-Limber Pine

Woodland

Alliance: Larix Iyallii-(Abies Iasiocarpa, Picea engelmannii)

Woodland

Classification Confidence Level: 2

Range: This association occurs primarily in the east Cascades from Mount Stuart north to near the British Columbia border and in the Northern Rockies.

<u>Plots</u>: 5, MORA (0), NOCA (4), OLYM (0), Other (1) <u>Environmental Description</u>: This subalpine woodland association occurs above continuous forest and below upper treeline. Its typical form is scattered to clustered patches of

trees across moderate to steep slopes at high elevation (2010-2290 m (6600-7500 ft)).

<u>Vegetation Description</u>: The open tree canopy is usually dominated by *Larix Iyallii* with *Picea engelmannii* and/or *Abies Iasiocarpa* usually present. *Pinus albicaulis* is absent or low in cover. The well-developed dwarf-shrub layer is co-dominated by the diagnostic shrubs, *Vaccinium scoparium, Vaccinium caespitosum or Vaccinium myrtillis. Phyllodoce empetriformis* is often present. *Luzula glabrata* var. *hitchcockii* is the most prominent herb. Other common herbs are *Valeriana sitchensis, Erigeron peregrinus, Lupinus* species, *Juncus parryii, Arenaria capillaris, Arnica latifolia*, and *Carex rossii*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association appears to be a transition between similar *Abies lasiocarpa* and *Tsuga mertensiana* associations. *Vaccinium caespitosum* is included in this association and expands the current concept.

Conservation Rank: S2

Rank Justification: This community appears to be widely distributed but occurs in isolated patches. It is located in the high elevations of the eastern Cascades in northern Washington into British Columbia. Its habitat is restricted by a limited area above closed forests. It occupies a relatively small acreage across this wide distribution. Climate change will likely affect this vegetation.

Pinus albicaulis Krummholz Shrubland

White-bark Pine Krummholz

Acronym: PINALB

NatureServe Code: Provisional

<u>Macrogroup</u>: Rocky Mountain Subalpine & High Montane Conifer Forest

Group: Northern Rocky Mountain Whitebark-Limber Pine Woodland

<u>Alliance</u>: *Pinus albicaulis* Krummholz Classification Confidence Level:

Range: This association occurs in the Cascades (mainly in rainshadow areas) and

possibly in the northeastern Olympic Mountains.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This association occurs at high elevations. Sites are located at the upper edge of the subalpine parkland and the lower part of the alpine

zone. Soils are well-drained.

<u>Vegetation Description</u>: The vegetation is dominated by shrub-form *Pinus*

albicaulis. Upright trees are absent or limited to occasional flags. Associated understory species are variable. Usually this vegetation occurs as well-defined patches near upper treeline.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This type is not represented in the current data for national parks in Washington.

Conservation Rank: S2S3

<u>Rank Justification</u>: This association is geographically restricted but widely distributed in the eastern Cascades. White pine blister rust (*Cronartium ribicola*), an exotic fungus, has caused extensive mortality in *Pinus albicaulis* within the range of this association and its impact in these harsh habitats are drastic. Climate change will very likely affect this vegetation.

Populus tremuloides Shrubland

Quaking Aspen Shrubland

<u>Acronym</u>: POPTRE shrub <u>NatureServe Code</u>: Provisional

Macrogroup: Rocky Mountain Subalpine & High Montane

Conifer Forest

Group: Rocky Mountain Subalpine and Montane Aspen

Forest and Woodland Group

Alliance: Populus tremuloides/(Acer circinatum-Cornus

nuttallii) Forest

Classification Confidence Level: 3

Range: This type was sampled in the North Cascades.

Plots: 1, MORA (0), NOCA (1), OLYM (0), Other (0)

<u>Environmental Description</u>: This association is represented by a single plot at 1045 m (3430 ft) elevation on a moderately steep, west-facing, debris avalanche slope. Evidence of past fire disturbance is suggested by charcoal on downed logs.

<u>Vegetation Description</u>: A well-developed tall shrub layer is dominated by shrub form *Populus tremuloides*. Other tall shrub species are *Acer circinatum* and *Amelanchier alnifolia* with the shorter shrub *Paxistima* (=Pachistima) myrsinites abundant. The herbaceous layer is rather sparse with *Pteridium aquilinum* the most abundant species.

USFWS Wetland System: Not applicable.

<u>Comments</u>: More plots are needed to better describe this provisional type and to distinguish it from related *Populus tremuloides* types

Conservation Rank: SUQ

Rank Justification: Insufficient information exists to rank this tentative association.

Synonyms:

Forest and Woodland Group

Alliance: Populus tremuloides/(Acer circinatum-Cornus

nuttallii) Forest

Classification Confidence Level: 3

Range: This association is described from one plot in the North Cascades Park and may be located elsewhere in the Cascades.

<u>Plots</u>: 1, MORA (0), NOCA (1), OLYM (0), Other (0) <u>Environmental Description</u>: The plot defining this vegetation type occurs at 340 m (1120 ft) elevation on a nearly flat, northeast slope.

<u>Vegetation Description</u>: This closed broadleaf forest is dominated by *Populus tremuloides* with *Acer macrophyllum*, *Populus balsamifera* ssp. *trichocarpa*, and a conifer - *Abies grandis* - each contributing under 20% cover. The short tree, *Cornus nuttallii* dominates the subcanopy. A sparse shrub layer includes *Rubus parviflorus*, *Symphoricarpos albus* and *Acer circinatum*. The sparse herb layer includes moist site species such as, *Athyrium filix-femina*, *Polystichum munitum*, and *Viola glabella*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association may be a broadleaf variant of the *Abies grandis / Cornus nuttallii - Acer glabrum* Forest association (CEGL001104) described from the southeast Cascades in Washington.

Conservation Rank: SUQ

Rank Justification: Insufficient information exists to rank this provisional association.

Synonyms:

Abies lasiocarpa-(Pseudotsuga menziesii)/Vaccinium membranaceum/Calamagrostis rubescens Forest

Subalpine Fir-(Douglas-fir)/Big Huckleberry/Pinegrass Forest

Acronym: ABILAS-(PSEMEN)/VACMEM/CALRUB

NatureServe Code: CEGL000342

Macrogroup: Rocky Mountain Subalpine & High Montane Conifer Forest

Group: Rocky Mountain Subalpine Dry-Mesic Spruce-Fir Forest and

Woodland

Alliance: Abies lasiocarpa - Picea engelmannii / Carex geyeri Forest

Classification Confidence Level: 3

Range: This association occurs in the east Cascades.

Plots: 3, MORA (0), NOCA (1), OLYM (0), Other (2)

Environmental Description: This association occurs at middle to high

elevations. Sites are relatively cool and on moderate slopes.

<u>Vegetation Description</u>: Abies lasiocarpa is dominant in the semi-open to closed tree canopy. *Picea engelmannii* and/or *Pseudotsuga menziesii* are usually present in the canopy. The shrub layer is typically moderately dense and dominated by *Vaccinium membranaceum* with *Paxistima* (=Pachistima) myrsinites. *Vaccinium scoparium* may be present. The herb layer is usually poorly developed with *Calamagrostis rubescens*, *Carex geyeri* and *Orthilia* (=Pyrola) secunda most common.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This may be equivalent to the *Abies lasiocarpa - Picea* <u>engelmannii / Vaccinium membranaceum</u> Rocky Mountain Forest

(CEGL000341) described in the Northern Rockies but with occasional Cascadian elements, for example *Vaccinium deliciosum*.

Conservation Rank: S3Q

Rank Justification: This association is represented by locations in the National Park system however, the majority of occurrences are not protected from alterations from threatening land uses.

Synonyms:

Abies lasiocarpa-(Pseudotsuga menziesii)/Vaccinium membranaceum Forest; Chappell 2005 NPK

Abies lasiocarpa-Picea engelmannii/Vaccinium scoparium Woodland

Subalpine Fir-Engelmann spruce/Grouse Whortleberry Woodland

<u>Acronym</u>: ABILAS-PICENG/VACSCO NatureServe Code: CEGL000344

<u>Macrogroup</u>: Rocky Mountain Subalpine & High Montane Conifer Forest <u>Group</u>: Rocky Mountain Subalpine Dry-Mesic Spruce-Fir Forest and Woodland

Alliance: Abies lasiocarpa - Picea engelmannii / Carex geyeri Forest

Classification Confidence Level: 3

Range: This association occurs in interior British Columbia, the Rocky Mountains,

and perhaps the east Cascades.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This woodland or open forest association may occur at moderately high elevations 1000-2000 m (3300 to 6230 ft). Sites usually have rocky soils that are well-drained and cold. Slopes tend to be gentle and variable in aspect.

<u>Vegetation Description</u>: The woodland or forest canopy is usually dominated by *Abies lasiocarpa. Pinus contorta* is occasionally prominent to co-dominant. *Picea engelmannii* and/or *Pseudotsuga menziesii* may also be present in the canopy. The dwarf-shrub layer is well-developed. *Vaccinium scoparium* and/or *Vaccinium myrtillus* are prominent, dominant and diagnostic. *Paxistima* (=Pachistima) myrsinites is occasionally prominent. The variable herb layer may contain *Carex geyeri* or *Polemonium pulcherrimum*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is not represented in the current data set of vegetation plots in national parks in Washington. Areas at higher elevations or westward sites with deep snowpack where the understory is dominated by *Luzula glabrata* var. hitchcockii with Arnica latifolia and Valeriana sitchensis are part of the preliminary Abies lasiocarpa/Vaccinium scoparium/ Valeriana sitchensis association. The Abies lasiocarpa- Picea engelmannii / Vaccinium scoparium association is a very broadly defined type and further comparison is needed between it and similar associations in the Cascades.

Conservation Rank: S3S4

<u>Rank Justification</u>: This association occurs within a restricted range with few threats. Climate change may effect this vegetation.

Synonyms:

NatureServe Code: CEGL000301

Macrogroup: Rocky Mountain Subalpine & High Montane Conifer Forest

Group: Rocky Mountain Subalpine Dry-Mesic Spruce-Fir Forest and Woodland

Alliance: Abies lasiocarpa - Picea engelmannii / Carex geyeri Forest

Classification Confidence Level: 2

Range: This association is known from central and eastern Washington and the

Rocky Mountains.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: Elevations range from 1460 to 1740 m (4800-5700 ft). Stands occur on cold, dry to mesic sites on mid to upper slopes on all aspects. Soils are frequently rocky although moderately so.

Vegetation Description: The typically open tree canopy is co-dominated by

Pseudotsuga menziesii and Abies lasiocarpa. Larix occidentalis, Pinus contorta and Picea engelmannii are frequently in the canopy as well. The shrub layer is sparse (under 10% cover). Calamagrostis rubescens dominates the herb layer. Arnica cordifolia, Chimaphila umbellata and Lupinus spp. are frequent.

USFWS Wetland System: Not applicable.

Comments: This association is not represented in the current data set of vegetation plots for national parks in Washington.

Conservation Rank: S4S5

<u>Rank Justification</u>: This association occurs within a wide range and faces threats from logging, livestock grazing and fire suppression effects.

Synonyms:

Abies lasiocarpa-(Picea engelmannii)/Rhododendron albiflorum Forest

Subalpine Fir-(Engelmann spruce)/Cascade Azalea Forest

<u>Acronym</u>: ABILAS/RHOALB <u>NatureServe Code</u>: CEGL000330

<u>Macrogroup</u>: Rocky Mountain Subalpine & High Montane Conifer Forest

Group: Rocky Mountain Subalpine Mesic-Wet Spruce-Fir Forest and Woodland

Alliance: Abies lasiocarpa - Picea engelmannii / Ribes spp. Forest

Classification Confidence Level: 2

Range: This association occurs in the east Cascade and Northern Rocky

Mountains.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This forest or woodland association is found at high elevations ranging from 1460 to 2075 m (4600-6800 ft). Sites have deep, slow melting snowpacks and tend to be on mid to upper slopes.

<u>Vegetation Description</u>: The woodland to forest canopy of this association is

usually co-dominated by *Abies lasiocarpa* and *Picea engelmannii*. The shrub layer is frequently dense and is dominated by *Rhododendron albiflorum*, typically with *Vaccinium membranaceum*. Low shrubs *Vaccinium scoparium* or *V. myrtillus* are usually present. The herb layer is sparse to moderately dense. A few areas at higher elevations or on west-facing sites with deep snowpack may be dominated by *Luzula glabrata* var. *hitchcockii* with *Valeriana sitchensis*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is not represented in the current plot data and may it might occur in the mountains near Lake Chelan. The absence or only presence of *Tsuga mertensiana* or *Abies amabilis* or presence of *Calamagrostis rubescens* help distinguish this association from similar forest types found further west in the Cascade Mountains.

Conservation Rank: S4

<u>Rank Justification</u>: This association is widespread in eastern Washington with few threats. Logging is a threat in part of its range.

<u>Macrogroup</u>: Rocky Mountain Subalpine & High Montane Conifer Forest

Group: Rocky Mountain Subalpine Mesic-Wet Spruce-Fir Forest and Woodland

Alliance: Abies lasiocarpa - Picea engelmannii / Ribes spp. Forest

Classification Confidence Level: 3

Range: This association occurs in the eastern North Cascades in Washington and

in adjacent British Columbia.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This cool, moist ,montane woodland association occurs between 640 to 1800 m (2100-5900 ft). Stands occur on moist sites on mid

to upper slopes on all aspects. Soils are deep and can be rocky.

Vegetation Description: The typically open tree canopy is co-dominated by Picea

engelmannii and a combination or one of the following: Abies lasiocarpa, Pseudotsuga menziesii, Pinus contorta or Larix occidentalis. Abies lasiocarpa and Picea engelmannii are often the most common tree species in the subcanopy. The shrub layer is poorly developed (under 10% cover) with Paxistima (=Pachistima) myrsinites or Vaccinium scoparium commonly present. Calamagrostis rubescens is present, but not dense, on most sites. The ground cover is dominated by Linnaea borealis. Orthilia (=Pyrola) secunda, Osmorhiza berteroi (=chilensis), Chimaphila umbellata and Thalictrum occidentale are frequent..

USFWS Wetland System: Not applicable.

Comments: This association is not represented in the current data set of vegetation plots in national parks in Washington.

Peninsula.

Plots: 35, MORA (0), NOCA (0), OLYM (35), Other (0)

Environmental Description: This association occurs at low elevations. Sites are relatively moist but not wet, with well-drained soils. Most often it is located on lower or toe slopes or riparian terraces. It is very extensive on high terraces of major rivers.

<u>Vegetation Description</u>: Picea sitchensis usually dominates the canopy or co-dominates with Tsuga heterophylla. Acer macrophyllum or Alnus rubra are sometimes prominent to co-dominant. Tree regeneration is dominated by Tsuga heterophylla and/or Picea sitchensis. The shrub layer is variable in abundance. When well-developed (mainly in major river valleys), it is dominated by the tall shrub Acer circinatum. Rubus spectabilis, Vaccinium alaskaense, and Vaccinium parvifolium are usually present in small amounts, though the former can be prominent. The well-developed herb layer is co-dominated by Polystichum munitum and Oxalis oregana. Athyrium filix-femina, Blechnum spicant, and Tiarella trifoliata are usually present. Tiarella trifoliata or Achlys (californica, triphylla) can be abundant.

USFWS Wetland System: Not applicable.

Comments: Most occurrences of this association are found on upland sites within valley bottoms.

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs in a limited range within Washington where much of it has been altered by forest harvesting. Recovery is expected within 100 years from time of stand replacement disturbances, if sites are not planted with Douglas-fir as they often are.

Thuja plicata-Tsuga heterophylla/Vaccinium ovatum Forest

Western Redcedar-Western Hemlock/Evergreen Huckleberry Forest

Acronym: THUPLI-TSUHET/VACOVA

NatureServe Code: Preliminary

Macrogroup: Vancouverian Lowland and Montane

Rainforest

Group: North Pacific Hypermaritime Western Red-cedar-

Western Hemlock Forest

Alliance: Tsuga heterophylla-Thuja plicata Hypermaritime

Forest

Classification Confidence Level: 2

Range: The association appears along the coastal strip of

Washington.

Plots: 17, MORA (0), NOCA (0), OLYM (17), Other (0)

Environmental Description: This association occurs at low elevations (typically less than 120 m (400 ft)) on flat to gentle sloping to concave sites on coastal terraces. Windstorms create the major disturbances in these forests.

<u>Vegetation Description</u>: Thuja plicata and Tsuga heterophylla dominate the canopy with Picea sitchensis only occasionally present. The very dense, tall-shrub layer (over 2m (6 ft)) is co-dominated by Gaultheria shallon and Vaccinium ovatum. Vaccinium alaskaense, V. parvifolium and Menziesia ferruginea are usually present to prominent or occasionally co-dominant. Blechnum spicant is always present and often prominent or dominant in the herb layer. The herb layer varies in total cover. Lysichiton americanus is frequently present but never abundant (under 5% cover). Polystichum munitum is absent or present only in low amounts. A diverse moss layer is typically present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: The set of plots from Olympic is on-average wetter than other sites documented for this type as indicated by the frequency of *Lysichiton americanus*. There is at least one known example of a coastal (Olympic NP) occurrence of *Thuja plicata-Tsuga heterophylla/Gaultheria shallon/Lysichiton americanus* forest association (CEGL003226) that has a high percent cover of *V. ovatum* and would be transitional to this association.

Conservation Rank: S1S2

<u>Rank Justification</u>: This association occurs only along the Pacific coast. Forests can be extremely old and many occurrences have been fragmented by timber harvests.

Macrogroup: Vancouverian Lowland and Montane Rainforest

Group: North Pacific Hypermaritime Western Red-cedar-Western Hemlock

Forest

Alliance: Tsuga heterophylla-Thuja plicata Hypermaritime Forest

Classification Confidence Level: 2

Range: This association occurs on the western Olympic Peninsula including the western Olympic Mountains and the western slopes of the Willapa Hills.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This association occurs at low elevations on well-drained soils and a variety of landforms including gentle to steep slopes, ridgetops, and rolling plains.

<u>Vegetation Description</u>: The tree canopy is always dominated or codominated by *Tsuga heterophylla. Abies amabilis* is sometimes present to co-dominant. Either of these species can dominate tree regeneration. *Thuja plicata* is occasionally present, but never co-dominant. *Gaultheria shallon* dominates the well-developed shrub layer. *Vaccinium alaskaense, V. parvifolium* and *Menziesia ferruginea* are usually present to prominent or occasionally co-dominant. The herb layer is variable in total cover. *Blechnum spicant* is always present and often prominent or dominating the herb layer. *Polystichum munitum* is absent or present only in low amounts.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This type is distinguished from *Tsuga heterophylla-Thuja plicata-(Abies amabilis)/Gaultheria shallon/Blechnum spicant* by the absence or low percent cover of *Thuja plicata*. This association is not represented in the current dataset of vegetation plots for national parks in Washington.

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs only along the Olympic Peninsula and the western Willapa Hills. Many occurrences have been fragmented by and altered by timber harvests.

Classification Confidence Level: 2

Range: This association occurs on the western Olympic Peninsula and south to the Willapa Hills.

Plots: 2, MORA (0), NOCA (0), OLYM (2), Other (0)

<u>Environmental Description</u>: This association occurs at low elevations in topographic settings that vary from flats to steep slopes. Soils are deep, well-drained, and relatively

moist.

<u>Vegetation Description</u>: The canopy is dominated by *Tsuga heterophylla. Thuja plicata* or *Abies amabilis* often occur in small amounts. *Pseudotsuga menziesii* occurs very infrequently. The well-developed shrub layer is dominated by *Gaultheria shallon. Vaccinium parvifolium* is always present and sometimes prominent. *Vaccinium alaskaense* and *Menziesia ferruginea* are usually present to prominent. The herb layer is usually well-developed and dominated by *Polystichum munitum*, *Blechnum spicant*, and/or *Oxalis oregana*. The former two species are always present. *Prosartes (=Disporum) smithii* and *Trillium ovatum* are usually present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is distinguished from similar ones by having over 5% cover of either *Polystichum munitum* or *Oxalis oregana*, in combination with over 1% cover of *Blechnum spicant*.

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs only on the Olympic Peninsula and in the Willapa Hills. Many occurrences have been fragmented by timber harvests.

NatureServe Code: CEGL000108

Macrogroup: Vancouverian Lowland and Montane Rainforest

Group: North Pacific Hypermaritime Western Red-cedar-Western Hemlock

Forest

Alliance: Tsuga heterophylla-Thuja plicata Hypermaritime Forest

Classification Confidence Level:

Range: This association occurs on the western Olympic Peninsula and at

Mount Rainier.

Plots: 4, MORA (4), NOCA (0), OLYM (0), Other (0)

Environmental Description: The environmental characteristics of this association have not been well described. It has been found at low elevations on moist sites with well-drained, deep soils.

<u>Vegetation Description</u>: The canopy is dominated by *Tsuga heterophylla*. *Pseudotsuga menziesii* is occasionally prominent. The shrub layer ranges from sparse to moderately dense. *Vaccinium alaskaense*, *V. parvifolium*, *Gaultheria shallon*, *Rubus spectabilis* and *Menziesia ferruginea* all occur in most stands. Only the *Vaccinium* spp. are sometimes prominent. The well-developed herb layer is co-dominated by *Polystichum munitum* and *Blechnum spicant*.

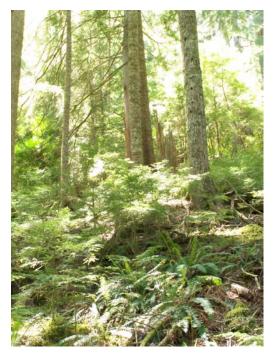

<u>Comments</u>: All current plots are at Mount Rainier (including three legacy plots) and are at mid-elevations on moderately steep slopes near "slide" areas. In addition to those species described above, these plots have abundant *Mahonia* (=Berberis) nervosa. These plots currently represent an expansion of this association's concept; it may be more appropriate to assign these plots to a new, undescribed type.

Conservation Rank: S2S3

<u>Rank Justification</u>: This association was previously known only along the Olympic Peninsula and Willapa Hills and is now recognized in the southern Cascades. Occurrences have been fragmented by timber harvests.

<u>Macrogroup</u>: Vancouverian Lowland and Montane Rainforest <u>Group</u>: North Pacific Maritime Douglas-fir-Western Hemlock Forest <u>Alliance</u>: Tsuga heterophylla - Pseudotsuga menziesii / (Cornus

unalaschkensis) Forest Alliance

Classification Confidence Level: 3

Range: This association is known to occur in the Olympic Mountains, in the southern end of the Puget Lowland in Washington, and in northwestern Oregon.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This lowland and montane foothill forest association is known to occur on gentle to moderately steep, generally northerly aspects in Oregon.

<u>Vegetation Description</u>: The canopy is dominated by *Pseudotsuga menziesii* with *Abies grandis* or *Acer macrophyllum* in the canopy; little or no *Tsuga heterophylla* or *Thuja plicata* is present. A generally dense tall shrub layer of *Acer circinatum* with *Corylus cornuta* appears with a diverse understory of shorter shrubs, *Mahonia* (=*Berberis*) *nervosa*, *Rosa gymnocarpa*, and herbaceous species. *Polystichum munitum* always occurs and is typically over 5% cover.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This is a newly recognized association as a result of the coastal correlation from northwest Oregon and new in Washington. This is not represented in the current data for national parks in Washington. Further sampling is needed to better characterize this association in Washington.

Conservation Rank: S2R

Rank Justification: This occurs within a limited range in Washington with insufficient information to rank.

Macrogroup: Vancouverian Lowland and Montane

Rainforest

Group: North Pacific Maritime Douglas-fir-Western Hemlock

Forest

Alliance: Tsuga heterophylla - Pseudotsuga menziesii /

(Cornus unalaschkensis) Forest

Classification Confidence Level: 3

Range: This association occurs in the Cascade Mountains.

Plots: 6, MORA (3), NOCA (3), OLYM (0), Other (0)

Environmental Description: This association occurs at moderate elevations (less than 915 m (3000 ft)) and moderate slopes (20-50%) with varying aspects. Topographic moisture ranges from moderate to moist.

<u>Vegetation Description</u>: Pseudotsuga menziesii dominates the semi-open to closed tree canopy. Thuja plicata or Abies grandis can be prominent. Tsuga heterophylla may be present but never prominent. The shrub layer is typically moderately dense and is dominated by Vaccinium membranaceum and V. parvifolium and Paxistima (=Pachistima) myrsinites may be prominent to present. The ground layer is usually poorly developed with Chimaphila umbellata, Linnaea borealis, and Pteridium aquilinum occasionally prominent.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association may crosswalk to *Tsuga heterophylla /Pachistima myrsinites/Clintonia uniflora* of Lillybridge et al (1995). The *Thuja plicatal Vaccinium membranaceum* association (CEGL000487) in Northern Rockies very similar but without Cascadian species (e.g. *Acer circinatum, Mahonia (=Berberis) nervosa, Vaccinium parvifolium*).

Conservation Rank: S2S3

Rank Justification: This preliminary association has a narrow geographical and ecological range.

Synonyms:

Tsuga heterophylla /Pachistima myrsinites/Clintonia uniflora; Lillybridge et al. 1995

Pseudotsuga menziesii/Acer circinatum/Mahonia nervosa Forest

Douglas-fir/Vine Maple/Dwarf Oregongrape Forest

<u>Acronym</u>: PSEMEN/ACECIR/MAHNER <u>NatureServe Code</u>: PNWCOAST_130

Macrogroup: Vancouverian Lowland and Montane

Rainforest

Group: North Pacific Maritime Douglas-fir-Western Hemlock

Forest

Alliance: Tsuga heterophylla - Pseudotsuga menziesii /

(Cornus unalaschkensis) Forest Alliance

Classification Confidence Level: 3

<u>Range</u>: This association occurs primarily in the North Cascades but is found elsewhere in the Cascades.

Plots: 17, MORA (5), NOCA (10), OLYM (0), Other (2)

Environmental Description: This association occurs at low to middle elevations 425-850 m (1400-2800 ft) on moderately steep to steep slopes (20-90%). Litter and mosses typically cover the rocky ground. Evidence of past fire is usually present.

<u>Vegetation Description</u>: The typically closed canopy is dominated by *Pseudotsuga menziesii*. Tsuga heterophylla or Thuja plicata is usually present but never prominent. Betula papyrifera can be prominent in the North Cascades. Mahonia (=Berberis) nervosa is typically prominent to dominant in the shrub layer. Acer circinatum (over 10%) dominates a well-developed tall shrub layer with Corylus cornuta, Acer glabrum or Amelanchier alnifolia also frequently present. Other occasionally prominent shrubs are Paxistima (=Pachistima) myrsinites, Spiraea betulifolia, Rosa gymnocarpa, and Mahonia aquilifolium. The herb layer is usually poorly developed. Trientalis borealis ssp. latifolia, Chimaphila umbellata, Pteridium aquilinum, and Maianthemum (=Smilacina) racemosum are frequently present but with low cover. Achlys (californica, triphylla) is absent to sparse. The ground moss layer can be prominent and is often composed of Hylocomium splendens, Eurhynchium oreganum, and Rhytidiadelphus triquetrus.

USFWS Wetland System: Not applicable.

Comments: This association is similar to *Pseudotsuga menziesii-Tsuga heterophylla/Mahonia nervosa* (PNWCOAST_189) but has little (under 10%) to no *Tsuga heterophylla* and features more dry site species (*Spiraea betulifolia, Rosa gymnocarpa*, and *Mahonia aquilifolium*). This type may represent a persistent, early seral stage of that association or the *Tsuga heterophylla/Mahonia nervosa* Association (Lillybridge et al. 1995) described from the Wenatchee National Forest. The Coastal correlation project identified a *Pseudotsuga menziesii/Mahonia nervosa-Acer circinatum* found primarily in the Oregon Cascades. That too is similar to the association described here, however it contains *Achlys (californica, triphylla)*, *Symphoricarpos hesperius (=mollis)*, *Polystichum munitum*, *Whipplea modestus* and *Vancouveria hexandra* which this one does not.

Conservation Rank: S3S4

<u>Rank Justification</u>: This association occurs within a limited geographic range and may be a persistent seral vegetation type maintained by fire.

Synonyms:

Pseudotsuga menziesii/Achlys triphylla Forest

Douglas-fir/Vanilla Leaf Forest

<u>Acronym</u>: PSEMEN/ACHTRI <u>NatureServe Code</u>: Preliminary

<u>Macrogroup</u>: Vancouverian Lowland and Montane Rainforest <u>Group</u>: North Pacific Maritime Douglas-fir-Western Hemlock Forest <u>Alliance</u>: Tsuga heterophylla - Pseudotsuga menziesii / (Cornus

unalaschkensis) Forest Alliance

Classification Confidence Level: 3

Range: This association occurs in the southern Cascades of Washington

and in the Olympic Mountains.

Plots: 8, MORA (7), NOCA (0), OLYM (1), Other (0)

Environmental Description: This association occurs at mid-elevations (730-1645 m (2400-5000 ft)) on gentle to steep, southerly slopes. The ground surface can be rocky.

<u>Vegetation Description</u>: Pseudotsuga menziesii dominates the canopy with few other prominent tree species. Acer circinatum is prominent in most stands, few other shrubs are prominent. Rosa gymnocarpa. Mahonia (=Berberis) nervosa, Symphoricarpos hesperius (=mollis) and Amelanchier alnifolia are frequently present with low cover. The herb layer is relatively diverse and always contains Achlys (californica, triphylla) that is prominent to abundant. Other frequent and prominent species in the herb layer include Moehringia (=Arenaria) macrophylla, Pteridium aquilinum, Viola sempervirens, Maianthemum (=Smilacina) stellatum, and Rubus ursinus.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This type is essentially the *Abies amabili-Pseudotsuga menziesiil Achlys (californica, triphylla)* association (CEGL000003) without the true firs in the upper canopy, which in this type are also poorly represented in the lower canopy. *Achlys* has not been identified in the North Cascades, thus the reason this type is restricted to the southern Cascades and Olympic Mountains.

Conservation Rank: S3S4

<u>Rank Justification</u>: This preliminary association occurs in a limited geographic range and may be a persistent seral vegetation type.

Forest

Alliance: Tsuga heterophylla - Pseudotsuga menziesii /

(Cornus unalaschkensis) Forest Alliance

Classification Confidence Level: 2

Range: This association occurs in the eastern and northeastern Olympic Mountains, slopes of Mount Rainier and possibly in the North Cascades.

Plots: 14, MORA (4), NOCA (0), OLYM (10), Other (0)

<u>Environmental Description</u>: This association occurs at low to middle elevations and occupies dry, often steep sites. It is usually found on southern or western aspects, with shallow or gravelly/stony soils.

<u>Vegetation Description</u>: The canopy is dominated by *Pseudotsuga menziesii*. Tsuga heterophylla or Thuja plicata may occur in small amounts in the understory (under 5-10% cover), but *Pseudotsuga* is usually the most abundant regernating tree. The shrub layer is well-developed and dominated by *Gaultheria shallon*. *Mahonia* (=Berberis) nervosa is usually prominent and *Vaccinium parvifolium* is usually present. *Acer circinatum* is prominent in many stands. *Holodiscus discolor* and *Rosa gymnocarpa* are frequent in small amounts. The herb layer is absent or rather poorly developed typically. *Festuca occidentalis* or *Linnaea borealis* are often present in small amounts.

USFWS Wetland System: Not applicable.

<u>Comments</u>: The Pseudotsuga menziesiil Gaultheria shallon-Holodiscus discolor association (PNWCOAST_121) is similar but has higher cover of Holodiscus discolor and lacks Acer circinatum and Vaccinium parvifolium.

Conservation Rank: S3

<u>Rank Justification</u>: In the lowlands, this association has been variously harvested for timber. More intact, higher quality stands occur in the foothills although their extent is unknown.

Forest

Alliance: Tsuga heterophylla - Pseudotsuga menziesii /

(Cornus unalaschkensis) Forest Alliance

Classification Confidence Level: 3

Range: This association occurs in the northern and eastern

Olympic Mountains and slopes of Mount Rainier.

Plots: 10, MORA (6), NOCA (0), OLYM (4), Other (0)

Environmental Description: This association occurs at low to middle elevations 10-900 m (30-3000 ft) on a wide range of slopes, although typically moderately steep and southerly. Evidence of past fire or other stand disturbance such as windthrow are usually present.

<u>Vegetation Description</u>: The canopy is dominated by *Pseudotsuga menziesii* with *Acer macrophyllum* or *Taxus brevifolia* occasionally prominent. *Tsuga heterophylla* is usually present but never prominent. The shrub layer varies from sparse to dense. *Mahonia* (=*Berberis*) *nervosa* is usually present and typically prominent to dominant. Other shrubs, such as, *Rosa gymnocarpa*, *Vaccinium parvifolium*, *Paxistima* (=*Pachistima*) *myrsinites* are typically present but with low cover. The remaining understory is usually poorly developed. *Achlys* (*californica*, *triphylla*) is present with over 1% cover. *Chimaphila umbellata*, *Pteridium aquilinum*, *Rubus ursinus*, *Trientalis borealis* ssp. *latifolia*, and *Linnaea borealis* are frequently present. *Polystichum munitum* if present is less than 5% cover.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is essentially the *Pseudotsuga menziesii-Tsuga heterophylla/Achlys triphylla* association (CEGL000090) but with little (under 10%) to no *Tsuga heterophylla,* and is likely to be an early seral stage of the same.

Conservation Rank: S3S4Q

<u>Rank Justification</u>: In the Puget lowlands, this association has been variously harvested for timber. More intact, higher quality stands occur in the foothills although their full extent is unknown.

Classification Confidence Level: 2

Range: This association occurs in the northern and eastern

Olympic Mountains and in the western Cascades.

Plots: 32, MORA (23), NOCA (0), OLYM (9), Other (0)

Environmental Description: This association occurs at low to middle elevation on middle to toe slopes with well-

drained, mesic soils.

<u>Vegetation Description</u>: The canopy is dominated by

Pseudotsuga menziesii or a mixture of that species and Tsuga heterophylla. Tsuga heterophylla dominates tree regeneration and always has over 10% total cover. Thuja plicata is sometimes prominent. The shrub layer varies in density. Acer circinatum is usually at least present and typically dominates when the shrub layer is well-developed. Mahonia (=Berberis) nervosa is usually present to prominent. Vaccinium parvifolium and Rosa gymnocarpa are usually present. The herb layer is relatively rich in species and high in cover. Achlys (californica, triphylla) is always at least prominent and can be dominant. Tiarella trifoliata, Maianthemum (=Smilacina) stellatum, and Linnaea borealis are usually present to prominent, with no more than 5% cover of Tiarella. Viola sempervirens, Cornus unalaschkensis (=canadensis), Polystichum munitum and Clintonia uniflora are usually present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This type is restricted to the southern Cascades and Olympic Mountains and *Achlys* has not been identified in the North Cascades.

Conservation Rank: S4

Rank Justification: This association is widespread in the southern Cascades in Washington and in the Olympic Mountains.

Forest

Alliance: Tsuga heterophylla - Pseudotsuga menziesii /

(Cornus unalaschkensis) Forest Alliance

Classification Confidence Level: 1

Range: This association occurs on the western slopes of the Cascades and on the Olympic Peninsula. It is absent from the outer coastal strip and infrequent to rare on the western side of the Olympic mountains.

<u>Plots</u>: 28, MORA (8), NOCA (2), OLYM (18), Other (0) <u>Environmental Description</u>: This association occupies relatively low to middle elevations and well-drained soils. These are moderately dry sites.

<u>Vegetation Description</u>: The canopy is usually co-dominated by *Pseudotsuga menziesii* and *Tsuga heterophylla*, though in any one stand one or the other could be dominant. Occasionally *Pseudotsuga* is entirely absent. *Thuja plicata* is usually prominent to occasionally co-dominant. The well-developed shrub layer is dominated by *Gaultheria shallon*. Typically, no other shrubs are prominent, though *Acer circinatum* occasionally can be. *Vaccinium parvifolium* and *Mahonia* (=Berberis) nervosa are usually present in small amounts. The herb layer is absent to rather sparse with *Linnaea borealis* the most frequent species. *Blechnum spicant* is usually absent, or if present, only in small amounts.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is similar to the *Pseudotsuga menziesii-Tsuga heterophyllal Gaultheria shallon-Mahonia nervosa* association. The former is strongly dominated by *Gaultheria shallon* with no or only low cover of *Mahonia nervosa* and generally less diverse, sparse understory

Conservation Rank: S4

<u>Rank Justification</u>: In western Washington, this association is widespread in the lowlands and Cascade and Olympic Mountains. Low elevation sites which occur outside the national parks are more likely logged to some degree or near residential development.

Macrogroup: Vancouverian Lowland and Montane

Rainforest

Group: North Pacific Maritime Douglas-fir-Western Hemlock

Forest

Alliance: Tsuga heterophylla - Pseudotsuga menziesii /

(Cornus unalaschkensis) Forest Alliance

Classification Confidence Level: 2

Range: This association occurs in the northern and eastern

Olympics and in the Cascade Mountains.

Plots: 27, MORA (11), NOCA (6), OLYM (3), Other (7)

<u>Environmental Description</u>: This association occurs at low to middle elevations. Sites have well-drained, often shallow, soils and are located on steep mid to upper slopes and ridgetops. This association occurs on dry topographic positions.

<u>Vegetation Description</u>: The typically closed canopy is dominated by *Pseudotsuga menziesii* or co-dominated by that species and *Tsuga heterophylla*. Tsuga heterophylla typically dominates tree regeneration and always occupies over10% total cover. This type includes stands with earlier- seral trees, such as *Pinus contorta*. The shrub layer varies from sparse to dense. *Mahonia* (=Berberis) nervosa is always present and typically prominent to dominant. *Acer circinatum* is often present to dominant in a well-developed tall shrub layer. *Vaccinium parvifolium* or *Paxistima* (=Pachistima) myrsinites are usually present. The herb layer is usually poorly developed with shade- tolerant species such as *Chimaphila umbellata* and *Goodyera oblongifolia* usually present. *Polystichum munitum* and *Linnaea borealis* are frequently present, the former always with under 3% cover.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Several North Cascades plots may represent a different colder, drier association. These plots have *Paxistima myrsinites* prominent in the understory, which is unusual for this association and suggests a strong similarity to the *Tsuga heterophylla/Mahonia nervosa* association as described on the Wenatchee National Forest (Lillybridge et al. 1995). The latter association has more *Abies grandis* and *Vaccinium membranaceum* and less *Acer circinatum* than the North Cascades plots described above.

Conservation Rank: S4

<u>Rank Justification</u>: In western Washington, this association is widespread in the lowlands and Cascade and Olympic Mountains. Low elevation sites which occur outside the national parks are more likely logged to some degree or near residential development.

Forest

Alliance: Tsuga heterophylla - Pseudotsuga menziesii /

(Cornus unalaschkensis) Forest Alliance

Classification Confidence Level: 2

Range: This association occurs in the western Cascades

and southern and western Olympic Mountains.

Plots: 20, MORA (10), NOCA (0), OLYM (10), Other (0)

<u>Environmental Description</u>: This association occurs at low to middle elevations on mid to toe slopes, valley bottoms

and benches with well-drained, moist soils.

Vegetation Description: The canopy is dominated by

Tsuga heterophylla or co-dominated by that species and Pseudotsuga menziesii. Thuja plicata is often prominent. Tsuga heterophylla dominates tree regeneration and Abies amabilis is often present in small amounts. The moderate to dense shrub layer is dominated or co-dominated by Vaccinium alaskaense. Vaccinium parvifolium is usually present and sometimes co-dominant. Gaultheria shallon and Acer circinatum are frequently present, the latter sometimes prominent. The herb layer is generally poorly developed. Blechnum spicant, Polystichum munitum, and Cornus unalaschkensis (=canadensis) are usually present in small amounts.

USFWS Wetland System: Not applicable.

<u>Comments</u>: The set of plots of this type from National Parks in Washington has more *Tiarella trifoliata* than most citations for this association, indicating somewhat more moist sites. It also suggests a possible transition to the *Tsuga heterophylla-Abies amabilis/Vaccinium alaskaense/Tiarella trifoliata* association (CEGL000009).

Conservation Rank: S4

Rank Justification: This association occurs in the mountains of western Washington and has been impacted by logging.

NatureServe Code: CEGL000492

Macrogroup: Vancouverian Lowland and Montane

Rainforest

Group: North Pacific Maritime Douglas-fir-Western Hemlock

Forest

Alliance: Tsuga heterophylla - Pseudotsuga menziesii /

(Cornus unalaschkensis) Forest Alliance

Classification Confidence Level: 1

Range: This association occurs in the western Cascades

and in the eastern to northern Olympics.

Plots: 24, MORA (10), NOCA (6), OLYM (5), Other (3)

Environmental Description: This association occurs mostly at middle elevations on mid to upper slopes. Sites occupied have well-drained, often shallow soils. These are relatively dry, cool sites compared to average *Tsuga heterophylla* sites.

<u>Vegetation Description</u>: The canopy is dominated by *Tsuga heterophylla* or co-dominated by that species and *Pseudotsuga menziesii*. The latter and *Thuja plicata* are almost always present. *Thuja plicata* is often prominent to occasionally co-dominant. *Abies amabilis* is frequent in small amounts. The understory is always relatively sparse. *Mahonia* (=Berberis) nervosa is always present in small amounts. *Chimaphila menziesii*, *Chimaphila umbellata*, or *Corallorhiza* spp. are present and diagnostic. *Vaccinium parvifolium* and *V. alaskaense* are also usually present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is easily confused with the preliminary *Pseudotsuga menziesii -Tsuga heterophylla* /Dep. Association. It is distinguished from that association by the presence of *Mahonia nervosa*, and at least one of the *Chimaphila* spp. or *Corallorhiza* spp. and the absence of moist-site indicators.

Conservation Rank: S3

Rank Justification: This association occurs within a narrow environmental range in the mountains of western Washington.

Synonyms:

Tsuga heterophylla/Berberis nervosa-CHME-NWW; Henderson et al. 1992

Western Hemlock-Douglas-fir/Alaska Blueberry/Oregon Oxalis Forest

Acronym: TSUHET-PSEMEN/VACALA/OXAORE

NatureServe Code: PNWCOAST_258

<u>Macrogroup</u>: Vancouverian Lowland and Montane Rainforest <u>Group</u>: North Pacific Maritime Douglas-fir-Western Hemlock Forest

Alliance: Tsuga heterophylla - Pseudotsuga menziesii / (Cornus unalaschkensis)

Forest Alliance

Classification Confidence Level: 2

Range: This association occurs in the southwestern Olympic Mountains and

possibly in the Carbon River valley at Mount Rainier. **Plots**: 7, MORA (0), NOCA (0), OLYM (7), Other (0)

Environmental Description: This association occurs at low elevations usually on

gentle slopes.

Vegetation Description: The canopy is co-dominated by Pseudotsuga menziesii

and Tsuga heterophylla, with the latter dominating tree regeneration. The well-developed shrub layer is dominated or co-dominated by Vaccinium alaskaense. Acer circinatum and Vaccinium parvifolium are usually present to co-dominant. The well-developed herb layer is dominated by Oxalis oregana. Polystichum munitum is usually present to prominent. Cornus unalaschkensis (=canadensis) is usually present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Fires are more frequent and the major factor distinguishing this association from the *Tsuga heterophyllal Vaccinium alaskaensel Oxalis oregana* Forest association (PNWCOAST_232). This type is distinguished from other associations with *Oxalis* by the prominence of both *Pseudotsuga menziesii* and *Vaccinium alaskaense*. The plots from the Olympics have a different set of associated species (e.g. less *Acer circinatum* and more *Blechnum spicant* and *Rubus pedatus*) than those from Oregon and the southern Washington Cascades. The plots described here appear to be transitional to *Tsuga heterophylla/Vaccinium alaksaensis/Oxalis oregana* and are less distinct from that association than the ones from farther south.

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs within a narrow geographic range and has been impacted by timber harvesting outside the parks.

Synonyms:

Forest Alliance

Classification Confidence Level: 3

Range: This association is defined from one plot in the North Cascades.

Plots: 1, MORA (0), NOCA (1), OLYM (0), Other (0)

Environmental Description: The plot representing this type occurs on a very steep valley wall with some small rocky outcrops and an abundance of down woody debris. It is located on a dry topographic position.

<u>Vegetation Description</u>: The dense canopy is co-dominated by *Tsuga heterophylla* and *Thuja plicata*. The lower canopy has a dense layer of *Taxus brevifolia* and *Tsuga*

heterophylla. Vaccinium parvifolium dominates the shrub layer although Acer circinatum, Oplopanax horridus, Vaccinium scoparium and Vaccinium ovalifolium are present. The herb layer is comprised of a variety of moist-site species including Adiantum pedatum, Blechnum spicant, Clintonia uniflora, Cornus unalaschkensis (=canadensis), and Trientalis borealis ssp. latifolia, none of which have cover over 3%.

USFWS Wetland System: Not applicable.

Comments: This provisional type is represented by a single plot.

Conservation Rank: SUQ

Rank Justification: Insufficient information exists to rank or verify this provisional association.

<u>Acronym</u>: PINCON-PSEMEN/GAUSHA NatureServe Code: CEGL000150

Macrogroup: Vancouverian Lowland and Montane

Rainforest

Group: North Pacific Maritime Douglas-fir-Western Hemlock

Forest

Alliance: Tsuga heterophylla - Pseudotsuga menziesii /

(Holodiscus discolor) Forest Alliance Classification Confidence Level: 2

Range: This association occurs in the Puget Lowlands, and

the Olympic and North Cascade Mountains.

Plots: 10, MORA (0), NOCA (2), OLYM (8), Other (0)

Environmental Description: This association occurs in a wide range of environments. Most locations are less than 850 m (2800 ft) elevation. Sites vary from flat terrain to steep slopes on variable aspects. These sites are dry to

moderately dry and appear to have relatively nutrient-poor soil. This type occurs on gravelly, sandy loam outwash deposits, glacial till, and sedimentary residuum. Soil depth can be quite shallow.

<u>Vegetation Description</u>: Pinus contorta usually dominates the tree layer with Pseudotsuga menziesii typically prominent to co-dominant. Pinus monticola is often present and can be prominent in the canopy. Tsuga heterophylla is usually present but with low abundance. The understory is a dense layer of Gaultheria shallon often with scattered Vaccinium parvifolium.

Vaccinium ovatum is a common member of Puget Lowland representatives of this association. Pteridium aquilinum, Mahonia (=Berberis) nervosa, Gaultheria ovatifolia and Pyrola picta are frequent species in the typically depauperate ground cover. The lichen Cladonia bellidiflora occurrs in most plots.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This is a persistent or long-lived, fire-maintained seral stage of either the *Pseudotsuga menziesii-Tsuga heterophyllal/Gaultheria shallon* association (CEGL000084) or *Pseudotsuga menziesii/Gaultheria shallon-Vaccinium parvifolium* association (PNWCOAST_124). The distinction between varieties *contorta* and *latifolia* in the lowlands west to the Cascades is rarely determined in field data. We assume that all *Pinus contorta* at low elevation (under 1970ft, 600 m) west of the Cascades is variety *contorta*.

Conservation Rank: S3

Rank Justification: This community has a somewhat restricted natural range in portions of the Puget Lowland and Georgia Depression of Washington and British Columbia. This is a mid-seral forest community that naturally depended upon a relatively specific fire regime or a fire mosaic landscape for its regeneration. Its area has been reduced by industrial forestry practices that emphasize monocultures of Douglas-fir. There are very few if any viable occurrences remaining, at least in Washington. Fire suppression is a long-term threat that may result in the future extinction of this community type. Management of the community with fire is currently unfeasible because of landscape conditions and societal constraints associated with high-intensity fire.

Forest

Alliance: Tsuga heterophylla - Pseudotsuga menziesii /

(Holodiscus discolor) Forest Alliance

Classification Confidence Level: 3

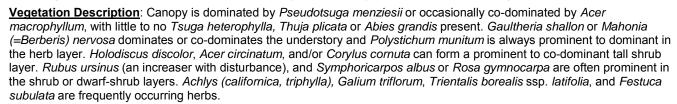

Range: This association occurs through much of lowland

western Washington.

Plots: 5, MORA (1), NOCA (0), OLYM (4), Other (0)

<u>Environmental Description</u>: These low elevation sites are moderately dry to mesic and appear to be relatively nutrientrich. Sites are flat to fairly steep, with aspects more often southerly to westerly. The plots represent a variety of slope

positions, including plateaus/plains. Parent materials are variable, including glacial till, glacial outwash, and various bedrock (including ultramafics). Soil textures are loam to loamy sand, usually with abundant coarse fragments.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is primarily a persistent, early seral stage of *Pseudotsuga menziesii-Tsuga heterophylla/Gaultheria shallon/Polystichum munitum* (CEGL000091) and *Pseudotsuga menziesii-Tsuga heterophylla/Mahonia nervosa-Polystichum munitum* associations (PNWCOAST_191).

Conservation Rank: S4S5

<u>Rank Justification</u>: In the lowlands, this association appears in the landscape now as young stands regenerating from previous harvest of *Pseudotsuga menziesii-Tsuga heterophylla* stands and many have been fragmented by development. More intact, higher quality stands occur in the foothills although their extent is unknown.

Alliance: Tsuga heterophylla - Pseudotsuga menziesii /

(Holodiscus discolor) Forest Alliance

Classification Confidence Level: 1

Range: This association occurs on the northern and eastern Olympic Peninsula and possibly in the western Cascades. It is most common in the Puget Lowland between the Cascades and Olympic Mountains.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

<u>Vegetation Description</u>: The canopy is dominated by *Pseudotsuga menziesii* or a mixture of that species and *Tsuga heterophylla*. Thuja plicata is often present and sometimes prominent to co-dominant. Tsuga heterophylla dominates tree regeneration and typically occupies over 10% total cover. The well-developed shrub layer is always dominated by *Gaultheria shallon*. Holodiscus discolor is always present and usually has over 2% cover. Mahonia (=Berberis) nervosa is usually prominent. Rosa gymnocarpa and Symphoricarpos hesperius (=mollis) are usually present. The herb layer is usually sparse. Typical species include *Linnaea borealis*, *Chimaphila umbellata*, *Achlys* (californica, triphylla), and *Campanula scouleri*.

USFWS Wetland System: Not applicable.

Comments: This association is not represented in the current dataset of vegetation plots for national parks in Washington.

Conservation Rank: S2S3

<u>Rank Justification</u>: The range of this association is somewhat restricted in the Puget Lowland and in the Olympic Mountains. Low elevation sites which occur outside the national parks are more likely logged to some degree or near residential development.

<u>Environmental Description</u>: This association occurs at mid elevations. Sites occupied are mid to upper slopes and ridgetops, have shallow rocky soils, and are moderately to very steep.

<u>Vegetation Description</u>: The canopy is co-dominated by *Pseudotsuga menziesii* and *Tsuga heterophylla. Thuja plicata* and *Abies amabilis* occur in about half the sampled stands, and the former can be prominent. The shrub layer can be rather sparse to well-developed. *Vaccinium alaskaense* may be absent but can dominate the shrub layer. *Mahonia* (=Berberis) nervosa is always present and often prominent. *Gaultheria shallon* and *Vaccinium parvifolium* are usually present. *Acer circinatum* is present and can be prominent. The herb layer is dominated by *Xerophyllum tenax*, which is always over 5% cover. *Linnaea borealis* and *Chimaphila umbellata* are frequent.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs within a narrow environment in the Olympic and southern Cascade Mountains in Washington.

Range: This association occurs in Olympic National Park

and in the western Cascades.

Plots: 10, MORA (1), NOCA (0), OLYM (9), Other (0)

Environmental Description: As defined, this association does not occur on floodplains. Sites are on lower or toe slopes or valley bottoms with moist, but not wet, soils but are otherwise not well described in Washington. Most of

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association was first described during the coastal correlation effort and it includes elements of several previously recognized conifer forest association (NatureServe: CEGL000114, CEGL000102, CEGL000092).

Conservation Rank: S4S5

<u>Rank Justification</u>: This association occurs within a narrow geographic and ecological range. It is currently recognized as a natural vegetation type that has been altered by logging. Most occurrences of this association, outside the national parks, are a result of regeneration after logging, though there are probably some natural-origin stands as well.

Classification Confidence Level: 2

Range: This association occurs in the western Cascades and on the Olympic

Peninsula, except for the western coastal plain.

Plots: 2, MORA (1), NOCA (0), OLYM (1), Other (0)

Environmental Description: Elevations are relatively low and soils are well-

drained and mesic to moist.

Vegetation Description: The canopy is dominated by Pseudotsuga menziesii

and/or Tsuga heterophylla. Both are always present and Tsuga heterophylla always contributes over 10% total cover. Tree regeneration is mostly Tsuga heterophylla. A well-developed tall-shrub layer dominated by Acer circinatum is often present. Other shrubs have low cover if they are present. The herb layer is dominated by Polystichum munitum. Other herbs are usually not very abundant. If present, Tiarella trifoliata, Blechnum spicant, Dryopteris expansa (=austriaca), and Athyrium filix-femina have very low percent cover.

Forest

Alliance: Abies amabilis - Tsuga heterophylla / (Blechnam

spicant) Forest Alliance

Classification Confidence Level: 1

<u>Range</u>: This association occurs on the lower western slopes of the Olympic Mountains and at Mount Rainier.

Plots: 3, MORA (1), NOCA (0), OLYM (2), Other (0)

Environmental Description: This type occurs on relatively

moist, relatively nutrient-poor sites.

<u>Vegetation Description</u>: The canopy is dominated by a somewhat variable mixture of *Tsuga heterophylla*, *Abies*

amabilis, and Thuja plicata. The latter is sometimes absent. Tree regeneration is dominated by Abies amabilis and Tsuga heterophylla. The well-developed shrub layer is dominated by Vaccinium alaskaense, with V. parvifolium prominent to codominant and Menziesia ferruginea usually prominent. The well-developed herb layer is dominated or co-dominated by Blechnum spicant. Cornus unalaschkensis (=canadensis) is usually present to prominent. Oxalis oregana and Gaultheria shallon occupy low cover if they are present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: The association was originally described from British Columbia and is poorly characterized in Washington. The Olympic plots are similar to descriptions of this type in British Columbia while the Mount Rainier location is a young stand with a sparse shrub layer and poorly fits this association.

Conservation Rank: S1

<u>Rank Justification</u>: This association occurs in a narrow environmental and geographic range western Washington with only a few known occurrences.

Tsuga heterophylla-Abies amabilis/Vaccinium alaskaense/Rubus pedatus Forest

Western Hemlock-Pacific Silver Fir/Alaska Blueberry/Trailing Raspberry Forest

Acronym: TSUHET-ABIAMA/VACALA/RUBPED

NatureServe Code: PNWCOAST_239

Macrogroup: Vancouverian Lowland and Montane

Rainforest

Group: North Pacific Mesic Silver Fir-Western Hemlock

Forest

Alliance: Abies amabilis - Tsuga heterophylla / (Blechnam

spicant) Forest Alliance

Classification Confidence Level: 1

Range: This association occurs on the western slopes of the Cascades and in the Olympic Mountains.

Plots: 45, MORA (35), NOCA (4), OLYM (6), Other (0)

<u>Environmental Description</u>: This upland forest association occurs at middle elevations. It is very extensive in areal coverage in moist climatic areas, where it occupies well-drained modal sites.

<u>Vegetation Description</u>: The canopy is usually co-dominated by *Tsuga heterophylla* and *Abies amabilis*, though any one stand might be dominated by one or the other. *Abies amabilis* is always present with at least 10% total cover, and typically dominates tree regeneration. *Cupressus* (=Chamaecyparis) nootkatensis, *Thuja plicata*, or *Pseudotsuga menziesii* are occasionally prominent. A well-developed shrub layer is always dominated by *Vaccinium alaskaense* or *V. ovalifolium*. The shrubs *Menziesia ferruginea, Vaccinium membranaceum or V. parvifolium* occur frequently but are rarely prominent. A herbaceous layer is always present and characterized by 3% or more combined cover of the following species: *Clintonia uniflora, Cornus unalaschkensis* (=canadensis), *Rubus pedatus*, *R. lasiococcus* or *Erythronium montanum* (latter is local, others widespread and frequent). *Blechnum spicant* is often present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Single plots from the North Cascades and the Olympics have high cover of *Acer circinatum* and represent transitions to warmer sites. A legacy plot from Olympic National Park, which appears in the stand table as PSEMENTSUHET/RUBPED, may also represent this type. It has *Abies amabilis* in minor amounts, no *Tiarella trifoliata* but an abundance of *Rubus pedatus* and is located within the environmental range of this association.

Conservation Rank: S4S5

Rank Justification: This association is widespread and occurs in the mountains of western Washington.

Classification Confidence Level: 1

Range: This association occurs in the western Cascades

and Olympic Mountains.

Plots: 28, MORA (22), NOCA (0), OLYM (6), Other (0)

<u>Environmental Description</u>: This association occurs at middle elevations. Sites have moist, well-drained to subirrigated soils in a variety of topographic positions.

<u>Vegetation Description</u>: The canopy is dominated by

Tsuga heterophylla and/or Abies amabilis (usually both). Abies amabilis occupies over 10% total cover (understory and canopy). Thuja plicata is occasionally prominent. Vaccinium alaskaense dominates the well-developed shrub layer. Rubus spectabilis is usually present. The diverse herb layer is usually well-developed. Blechnum spicant, Tiarella trifoliata var. unifoliata, Streptopus lanceolatus (=roseus) var. curvipes, Athyrium filix-femina, Clintonia uniflora, Cornus unalaschkensis (=canadensis), and Rubus pedatus are usually present. Maianthemum dilatatum sometimes dominates the herb layer.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is distinguished from similar types by over 3% combined cover of *Tiarella trifoliata* var. *unifoliata*, *Streptopus lanceolatus* var. *curvipes*, and *Maianthemum dilatatum*.

Conservation Rank: S4

Rank Justification: This association occurs in the mountains of western Washington.

Classification Confidence Level: 1

Range: This association occurs at Mount Rainier and in the eastern and northern Olympic Mountains.

Plots: 15, MORA (13), NOCA (0), OLYM (1), Other (1)

Environmental Description: This association occurs at middle elevations

on sites with deep, well-drained, and moist soils.

Vegetation Description: The canopy is dominated by *Abies amabilis*, Pseudotsuga menziesii, Tsuga heterophylla, and/or Abies procera. Abies amabilis has over 10% total cover and dominates or co-dominates tree regeneration. The shrub layer varies from sparse to moderate and frequently has abundant Acer circinatum or Vaccinium membranaceum (the latter usually no more than 10% cover). The well-developed herb layer always has Achlys (californica, triphylla) present to more often prominent. Tiarella trifoliata var. unifoliata and/or Maianthemum stellatum are usually present and the combination of the two is typically over 5% cover. Clintonia uniflora is usually present to prominent. Linnaea borealis, Gymnocarpium dryopteris or Cornus unalaschkensis (=canadensis) are occasionally prominent.

Comments:

Conservation Rank: S3S4

Rank Justification: Many natural-origin stands occur on protected lands although many are subject to logging and development.

Group: North Pacific Mesic Silver Fir-Western Hemlock

Forest

Alliance: Abies amabilis - Tsuga heterophylla -

(Pseudotsuga menziesii) / (Achlys triphylla) Forest Alliance

Classification Confidence Level: 3

Range: This provisional association is found throughout the range of *Abies amabilis* forests in the Cascades and the Olympic mountains.

Plots: 11, MORA (4), NOCA (2), OLYM (3), Other (2)

<u>Environmental Description</u>: These are generally mid-seral forests with prolonged closed canopies.

<u>Vegetation Description</u>: These forests are dominated by *Abies amabilis* and *Tsuga heterophylla*, and sometimes codominated by *Pseudotsuga menziesii. Thuja plicata* is frequently prominent. Deep shade and abundant litter accumulation limit the understory to isolated individuals of vascular plants and mosses and lichens. *Vaccinium parvifolium*, *V. alaskaense*, *Orthilia* (=*Pyrola*) secunda, and *Goodyera oblongifolia* are relatively frequent understory vascular plants.

USFWS Wetland System: Not applicable.

<u>Comments</u>: These communities are distingushed by a lack plant diversity, understory development and indicator vascular species.

Conservation Rank: S3S4Q

Rank Justification: This association appears to be widespread and in protected areas but classification is provisional.

Forest

Alliance: Abies amabilis - Tsuga heterophylla -

(Pseudotsuga menziesii) / (Achlys triphylla) Forest Alliance

Classification Confidence Level: 1

Range: This association occurs at middle elevations in the western Cascades and in the Olympic Mountains.

Plots: 41, MORA (23), NOCA (3), OLYM (15), Other (0)

Environmental Description: This association occurs at middle elevations on well-drained soils and moderate to somewhat dry sites on a variety of topographic settings.

<u>Vegetation Description</u>: The canopy is usually co-dominated by *Tsuga heterophylla*, *Abies amabilis*, and *Pseudotsuga menziesii* (latter often absent). *Abies amabilis* dominates tree regeneration and occupies over 10% total cover. The shrub layer is usually well-developed but is occasionally very sparse. *Vaccinium alaskaense* dominates the shrub layer and is always present. *Mahonia* (=Berberis) nervosa is sometimes prominent to co-dominant. The herb layer is usually sparse to occasionally moderate, with *Clintonia uniflora* and *Cornus unalaschkensis* (=canadensis) the only species present in many stands. *Linnaea borealis* or *Xerophyllum tenax* are occasionally prominent to dominant.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This type is distinguished from similar types by either (1) over 5% cover of *Mahonia (=Berberis) nervosa*, *Xerophyllum tenax* or *Linnaea borealis*, (2) co-dominance of *Pseudotsuga menziesii*, or (3) absence or trace amounts of both *Rubus pedatus* and *Blechnum spicant* particularly when total herb layer is under 5%. This concept changes the NatureServe name and follows the Coastal Correlation (Meidinger et al 2005).

Conservation Rank: S4

Rank Justification: This association is widespread and occurs commonly in the mountains of western Washington and has been impacted by logging.

Abies amabilis-(Pseudotsuga menziesii-Abies procera)/Vaccinium membranaceum/Xerophyllum tenax Forest

Pacific Silver Fir/Big Huckleberry/Beargrass Forest

Acronym: ABIAMA-(PSEMEN-ABIPRO)/VACMEM/XERTEN

NatureServe Code: CEGL000239

<u>Macrogroup</u>: Vancouverian Lowland and Montane Rainforest Group: North Pacific Mesic Silver Fir-Western Hemlock Forest

Alliance: Abies amabilis - Tsuga heterophylla - (Pseudotsuga menziesii) /

(Rhododendron albiflorum Forest Alliance

Classification Confidence Level: 1

Range: This association occurs at Mount Rainier and in the northern and eastern Olympics.

Plots: 32, MORA (32), NOCA (0), OLYM (1), Other (0)

Environmental Description: This association occurs at middle to high elevations. Sites are dry, usually on mid to upper slopes or ridgetops, with shallow or rocky soils and southerly aspects.

<u>Vegetation Description</u>: The canopy is dominated by *Abies amabilis*, <u>Pseudotsuga menziesii</u>, <u>Tsuga heterophylla</u>, and/or <u>Abies procera</u>. <u>Abies amabilis</u> or <u>A. procera occupy over 10% total cover</u>. <u>Abies amabilis</u> typically dominates tree regeneration. The shrub layer varies from sparse to dense but always has <u>Vaccinium membranaceum</u>, which usually is dominant. <u>Xerophyllum tenax</u> dominates a well-developed herb layer. <u>Rubus lasiococcus</u>, <u>Orthilia</u> (=Pyrola) secunda, <u>Clintonia uniflora</u> or <u>Viola sempervirens</u> are often present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Three legacy plots at Mount Rainier are dominated by *Pseudotsuga menziesii* with *Abies amabilis* or *Abies procera* present only in small amounts. These are currently recognized as variants of the association described here, though they could possibly be recognized as a distinct association.

Conservation Rank: S4

<u>Rank Justification</u>: Many natural-origin stands occur on protected lands however, non-protected stands are subject to logging and development.

Rainforest

Group: North Pacific Mesic Silver Fir-Western Hemlock

Forest

Alliance: Abies amabilis - Tsuga heterophylla -

(Pseudotsuga menziesii) / (Rhododendron albiflorum Forest

Alliance

Classification Confidence Level: 1

Range: This association occurs in both the Cascades, and

less commonly, in the Olympic Mountains.

Plots: 13, MORA (7), NOCA (3), OLYM (1), Other (2)

Environmental Description: This association occurs at middle to high elevations. Sites have well-drained, often shallow or rocky soils, and occur mostly on southerly aspects and mid to upper slopes. Sites east of the Cascade crest are generally more variable in topography and soils.

<u>Vegetation Description</u>: Abies amabilis, Tsuga heterophylla, and/or Pseudotsuga menziesii dominate the canopy, however the latter two species are not always present. Abies lasiocarpa is occasionally prominent. Abies amabilis has over 10% total cover and usually dominates tree regeneration. The shrub layer ranges from sparse to moderately dense and is characterized by the presence to dominance of Vaccinium membranaceum. Vaccinium alaskaense occurs only infrequently and in small amounts (under 5% cover). The herb layer is typically sparse but can infrequently have moderate cover. Clintonia uniflora, Rubus lasiococcus, and Orthilia (=Pyrola) secunda are frequently present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This type is distinguished from similar ones by the infrequent occurrence and low cover, if present, of Xerophyllum tenax, Valeriana sitchensis, Arnica latifolia, Acer circinatum, Vaccinium alaskaense, and Achlys (californica, triphylla).

Conservation Rank: S4

<u>Rank Justification</u>: Many natural-origin stands occur on protected lands however, some non-protected stands are subject to logging and development.

Abies amabilis/Vaccinium membranaceum /Rubus lasiococcus Forest

Pacific Silver Fir/Big Huckleberry/ Dwarf Bramble Forest

Acronym: ABIAMA/VACMEM/RUBLAS
NatureServe Code: CEGL000236

<u>Macrogroup</u>: Vancouverian Lowland and Montane Rainforest <u>Group</u>: North Pacific Mesic Silver Fir-Western Hemlock Forest

<u>Alliance</u>: Abies amabilis - Tsuga heterophylla - (Pseudotsuga menziesii) /

(Rhododendron albiflorum Forest Alliance

Classification Confidence Level: 2

Range: This association occurs in both the Cascade, and less commonly, the Olympic Mountains.

Plots: 44, MORA (37), NOCA (0), OLYM (3), Other (4)

Environmental Description: This association occurs at middle to high elevations. Sites have well-drained, often shallow or rocky soils, and occur mostly on south to west aspects and mid to upper slopes. Sites east of the Cascade crest are generally more variable in topography and soils.

<u>Vegetation Description</u>: The canopy is dominated by *Abies amabilis*, *Abies procera*, and/or *Cupressus* (=Chamaecyparis) nootkatensis. Abies amabilis has over 10% total cover and usually dominates tree regeneration. Tsuga heterophylla, and/or Pseudotsuga menziesii are occasionally prominent. Although Tsuga mertensiana occurs frequently, it always displays less than 10% cover. The presence to dominance of *Vaccinium membranaceum* characterizes the open to moderately dense shrub layer. Other shrubs such

as Sorbus sitchensis, Rhododendron albiflorum, and Vaccinium ovalifolium occur only infrequently and in small amounts (under 5% cover). The herb layer is typically sparse or infrequently moderate in cover. Valeriana sitchensis, Arnica latifolia, Rubus lasiococcus, and Erythronium montanum are frequently present. Achlys (californica, triphylla), Clintonia uniflora, Rubus pedatus, and Tiarella trifoliata can be prominent.

USFWS Wetland System: Not applicable.

<u>Comments</u>: The citations describing this association do not fit well within the types described in the coastal correlation project (Meidinger et al. 2005) and were not included in that work. This type is distinguished from similar ones by frequent occurrence and significant cover of *Valeriana sitchensis*, *Arnica latifolia*, and *Rubus lasiococcus*. Higher elevation sites with *Abies lasiocarpa* are *Abies lasiocarpa-(Abies amabilis)/Vaccinium membranaceum/Valeriana sitchensis* Forest (CEGL002612).

Conservation Rank: S3S4

Rank Justification: Many natural-origin stands occur on protected lands although many are subject to logging and development.

Acer macrophyllum-(Pseudotsuga menziesii)/Polystichum munitum Forest

Bigleaf Maple-(Douglas-fir)/Swordfern Forest

Acronym: ACEMAC-(PSEMEN)/POLMUN

NatureServe Code: Preliminary

Macrogroup: Vancouverian Lowland and Montane

Rainforest

Group: North Pacific Red Alder-Bigleaf Maple-Douglas-fir

Forest

Alliance: Acer macrophyllum-(Pseudotsuga menziesii)

Forest

Classification Confidence Level: 3

Range: This association occurs in the Olympic and the

Cascade Mountains.

Plots: 9, MORA (0), NOCA (1), OLYM (8), Other (0)

Environmental Description: This association occurs at elevations generally below 760 m (2500 ft). Slope gradients are moderate to very steep. Sites are sometimes associated with old debris flows or on slopes. Some stands show

evidence of disturbance from mass movements or tree harvesting. Sites can be heavily browsed. This association is seral, developing very commonly after logging and less commonly after fire.

<u>Vegetation Description</u>: This broadleaf or mixed forest association is dominated to co-dominated by *Acer macrophyllum*. Pseudotsuga menziesii is often co-dominant. Shrubs, usually *Mahonia* (=Berberis) nervosa, or less often *Holodiscus discolor*, are typically scattered when present but can form dense patches. *Acer circinatum* can occur abundantly as a tall shrub layer. Rubus ursinus is a frequent dwarf-shrub. *Polystichum munitum* characteristically dominates the understory and may appear to be the only understory species. Typically other herbaceous species are present to prominent, including *Achlys* (californica, triphylla), *Prosartes* (=Disporum) hookeri, *Trientalis borealis* ssp. *latifolia* and *Asarum caudatum*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: There is possible confusion or overlap between this association and *Acer macrophyllum-Alnus rubra/Polystichum munitum-Tellima grandiflora* (CEGL003334) of the Puget Trough lowlands. The latter is confined to coastal bluffs or landslide slopes and is characterized by substantial *Tellima grandiflora*, with much greater abundance of *Rubus spectabilis*, *Sambucus racemosa*, *Oemleria cerasiformis* and *Urtica dioica*. *Acer macrophyllum-(Pseudotsuga menziesii)/Polystichum munitum* also commonly occurs in the Puget Trough lowlands where it is apparently confined to previously logged sites.

Conservation Rank: S4S5

Rank Justification: This association occurs in a wide range of environments and is associated with past disturbances.

Synonyms:

Classification Confidence Level: 3

Range: This association is represented by a single plot in the North

Cascades.

Plots: 1, MORA (0), NOCA (1), OLYM (0), Other (0)

Environmental Description: This association occurs at 945 m (3100 ft) elevation on a steep, southwest facing, old debris avalanche slope (72% gradient). Soil is rocky with very little soil development. Fire scars and charcoal are present on downed trees.

<u>Vegetation Description</u>: A well-developed tall shrub layer is dominated by shrub-form *Acer macrophyllum*. Other tall shrub species are *Acer circinatum* and *Amelanchier alnifolia* with the shorter shrub, *Paxistima* (=*Pachistima*) *myrsinites*, abundant. The herb layer is sparse with *Pteridium aquilinum* most abundant.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S2S4Q

Rank Justification: There is insufficient information to assess this provisional association.

Synonyms:

Acer macrophyllum/Symphoricarpos albus Forest

Bigleaf Maple/Common Snowberry Forest

Acronym: ACEMAC/SYMALB

<u>Macrogroup</u>: Vancouverian Lowland and Montane Rainforest <u>Group</u>: North Pacific Red Alder-Bigleaf Maple-Douglas-fir Forest <u>Alliance</u>: Acer macrophyllum-(Pseudotsuga menziesii) Forest

Classification Confidence Level: 3

Range: This association is described from the North Cascades.

Plots: 4, MORA (0), NOCA (4), OLYM (0), Other (0)

Environmental Description: This low to mid-elevation association appears mostly on moderately steep slopes, including talus.

<u>Vegetation Description</u>: This broadleaf forest is typically dominated by *Acer macrophyllum* and/or co-dominated by *Pseudotsuga menziesii*. The canopy can occasionally be of short stature. A dense shrub layer characterizes this association. *Symphoricarpos albus* is the most common shrub and is often very abundant. *Cornus nuttallii* and *Salix scouleriana* can be prominent tall shrubs. Other shrubs include *Paxistima* (=*Pachistima*) *myrsinites*, *Rubus parviflorus*, *Rosa gymnocarpa* or *Philadelphus lewisii*. *Maianthemum* (=*Smilacina*) *racemosum*, *Prosartes* (=*Disporum*) *hookeri*, *Osmorhiza berteroi* (=*chilensis*), *Pteridium aquilinum*, and *Elymus glaucus* are frequent and prominent members of the herb layer.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Two plots contain typical east Cascades species, such as, *Pinus ponderosa* and *Calamagrostis rubescens*. Although similarly named, the Willamette valley *Acer macrophyllum-Abies grandis/Symphoricarpos albus* Forest association (CEGL000512) is a riparian type and has a very different list of associated species.

Conservation Rank: S3S4Q

Rank Justification: This is a preliminary association currently represented by four locations all within protected areas. It may be more extensive.

Alnus rubra/Alnus viridis ssp. sinuata Forest

Red Alder/Sitka Alder Forest

<u>Acronym</u>: ALNRUB/ALNVIR <u>NatureServe Code</u>: Provisional

<u>Macrogroup</u>: Vancouverian Lowland and Montane Rainforest <u>Group</u>: North Pacific Red Alder-Bigleaf Maple-Douglas-fir Forest

Alliance: Alnus rubra-(Picea sitchensis-Tsuga heterophylla) Forest and

Woodland

Classification Confidence Level: 3

<u>Range</u>: This association is described from Mount Rainier and could occur elsewhere in the Cascades and Olympic Mountains.

Plots: 3, MORA (3), NOCA (0), OLYM (0), Other (0)

Environmental Description: This association occurs at mid-elevations 750-920 m (2500-3000 ft) on gentle north facing slopes. It appears near rivers, debris chute runouts or other frequently disturbed sites. Surficial sandy soil indicative of flooding can be present as well as flood-transported woody debris. These features suggest relatively frequent flooding and/or early successional status.

<u>Vegetation Description</u>: Young *Alnus rubra* forests are typical of this association. Large-diameter *Pseudotsuga menziesii* snags or remnant trees are usually present. *Tsuga heterophylla, Thuja plicata* or *Abies amabilis* are usually present with low cover. *Alnus rubra* tree canopy is dense but relatively short-statured. *Alnus viridis* ssp. *sinuata* and *Rubus spectabilis*

USFWS Wetland System: Not applicable.

<u>Comments</u>: This provisional type may be transitory and not represent a stable plant association. More riparian sampling is needed to fully describe this type and resolve its status.

Conservation Rank: S3S4Q

Rank Justification: This provisional association occurs on naturally disturbed sites and currently is represented in protected areas.

Alnus rubra/Polystichum munitum Forest

Red Alder/Swordfern Forest

Acronym: ALNRUB/POLMUN
NatureServe Code: CEGL000638

Macrogroup: Vancouverian Lowland and Montane

Rainforest

Group: North Pacific Red Alder-Bigleaf Maple-Doug fir

Forest

Alliance: Alnus rubra-(Picea sitchensis-Tsuga heterophylla)

Forest and Woodland

Classification Confidence Level: 2

Range: This association is described from the Puget Lowlands, Mount Rainier and the Olympic Mountains.

Plots: 4, MORA (1), NOCA (0), OLYM (3), Other (0)

<u>Environmental Description</u>: This association occurs on upland slopes (varying steepness) usually with mesic, well-drained soils. It is not associated with riparian landforms, rather it is result of succession after fires, logging, landslides or slope failures.

<u>Vegetation Description</u>: This forest association is dominated by *Alnus rubra*. The herb layer is always dominated by *Polystichum munitum*. Other frequently occurring species include *Claytonia* (=Montia) sibirica, *Athyrium filix-femina*, *Anaphalis margaritacea*, and *Tellima grandiflora*. If present, a well-developed shrub layer is usually dominated by *Rubus spectabilis*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Sites found on landslide deposits, especially at lower elevations, are similar to the *Acer macrophyllum - Alnus rubra | Polystichum munitum - Tellima grandiflora* Forest (CEGL003334) but differ in no or low cover of *Acer macrophyllum, Holodiscus discolor, Rubus parviflorus, Blechnum spicant,* and *Tiarella trifoliata*.

Conservation Rank: S4

Rank Justification: This association occurs in a wide range and is associated with past disturbances.

Plots: 1, MORA (1), NOCA (0), OLYM (0), Other (0)

Environmental Description: This vegetation appears at 775 m (2540 ft) elevation on an old lahar surface.

Vegetation Description: This mixed forest canopy is co-

dominated by *Populus balsamifera* ssp. *trichocarpa* and *Alnus rubra*. *Tsuga heterophylla* and *Thuja plicata* are occasionally prominent. An open shrub layer of *Rubus spectabilis* may be present. The herbaceous layer is dominated by *Rubus ursinus* and *Pyrola asarifolia*. *Polystichum munitum* and *Equisetum arvense* are prominent.

USFWS Wetland System: Not applicable.

<u>Comments</u>: The one plot of this type may represent a unique type or may represent a variant of the riparian *Populus balsamifera* ssp. *trichocarpa-Alnus rubral Rubus spectabilis* association (CEGL003407).

Conservation Rank: SUQ

Rank Justification: Insufficient information exists to rank this provisional association.

Abies lasiocarpa-(Pinus contorta)/Lupinus (arcticus, latifolius) Woodland

Subalpine Fir/Lupine Woodland

<u>Acronym</u>: ABILAS-(PINCON)/LUPARC <u>NatureServe Code</u>: CEGL000316

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest

and Tree Island Group

<u>Alliance</u>: Abies lasiocarpa - (Picea engelmannii) / (Rubus

lasiococcus) Forest Alliance

Classification Confidence Level: 2

Range: This association occurs only in the northeastern

Olympic Mountains.

Plots: 5, MORA (0), NOCA (0), OLYM (5), Other (0)

Environmental Description: Sites are dry, upper slopes and ridgetops on southwestern aspects between 1500 and 1850 m (4900-6070 ft) elevation within the driest portion of the rainshadow.

<u>Vegetation Description</u>: The upper canopy of this woodland or open forest association is relatively short. In the plots from the parks, the canopy is dominated by *Abies lasiocarpa*. *Pinus contorta* can be dominant or co-dominant. A shrub layer is largely absent, although the dwarf-shrub *Juniperus communis* is occasionally prominent. The herb layer is dominated by *Lupinus* (arcticus ssp. subalpinus, latifolius), which has a mean cover of 15%, and occasionally co-dominated by *Arnica cordifolia*. Other frequent understory species that occur in low abundance are *Paxistima* (=Pachistima) myrsinites, *Lomatium martindalei*, *Orthilia* (=Pvrola) secunda, *Hieracium albiflorum*, and *Valeriana sitchensis*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is distinguished from similar associations by having over 3% cover of *Lupinus (arcticus, latifolius)*, along with little to no *Abies amabilis*, *Tsuga heterophylla*, *Tsuga mertensiana*, *Rhododendron albiflorum* (under 10%), *Vaccinium membranaceum* (under 5%), *Valeriana sitchensis*, or *Luzula glabrata* var. *hitchcockii* (under 3%).

Conservation Rank: S2

<u>Rank Justification</u>: This association has a very limited geographic and environmental range, specifically dry sites at high elevations in the extreme rainshadow of the northeastern Olympic Mountains. It probably has not declined much and is mostly in good condition, nor does it face significant near-term threats. The global rank was changed from G3 to G2 to reflect its limited environmental range and occurrence near treeline; this type may be sensitive to compositional changes related to global climate change.

Synonyms:

Abies lasiocarpa-(Pinus contorta)/Lupinus arcticus ssp. subalpinus Woodland; Chappell 2005 NPK Abies lasiocarpa/Lupinus latifolius Association; Henderson et al. 1989 Abies lasiocarpa/Lupinus latifolius-NWW; Henderson et al. 1989

Abies lasiocarpa/Vaccinium scoparium/Valeriana sitchensis Woodland

Subalpine Fir/Grouse Whortleberry/Sitka Valerian Woodland

<u>Acronym</u>: ABILAS/VACSCO/VALSIT **NatureServe Code**: Preliminary

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest

and Tree Island Group

Alliance: Abies lasiocarpa - (Picea engelmannii) / (Rubus

lasiococcus) Forest Alliance

Classification Confidence Level: 2

Range: This association occurs in Mount Rainier.

Plots: 6, MORA (5), NOCA (0), OLYM (0), Other (1)

Environmental Description: This parkland forest association occurs at high elevation on steep slopes. Sites have well-drained soils and often have southern aspects.

<u>Vegetation Description</u>: This is a conifer forest or woodland of relatively short stature. *Abies lasiocarpa* is always dominant (less than 50% cover). *Picea engelmannii*

or *Pinus contorta* may sometimes occur in the canopy. The dwarf-shrub *Vaccinium scoparium* is prominent to dominant. The herbaceous understory is relatively diverse but typically with low cover. *Valeriana sitchensis, Lupinus (arcticus ssp. subalpinus, latifolius), Luzula glabrata* var. *hitchcockii, Xerophyllum tenax, Arnica latifolia* and *Polemonium pulcherrimum* are usually present to prominent.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This is a Cascadian version of the Northern and Central Rocky Mountain *Abies lasiocarpa - Picea engelmannii / Vaccinium scoparium / Thalictrum occidentale Forest* (CEGL005919). The Rocky Mountain association has an abundance of *Thalictrum occidentale* and lacks more Cascadian species such as *Rubus lasiococcus*.

Conservation Rank: S3Q

<u>Rank Justification</u>: This preliminary association occurs within a limited range with few threats. Climate change will likely affect this vegetation.

Synonyms:

Alliance: Abies lasiocarpa - (Picea engelmannii) / (Rubus

lasiococcus) Forest Alliance

Classification Confidence Level: 3

Range: This association occurs in the eastern North Cascades and isolated high peaks in the Okanogan Highlands in Washington and adjacent British Columbia.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This cold, dry, montane woodland association occurs at elevations from 2040 to 2150 m (6700-7050 ft). Stands occur on very cold sites on upper slopes on northern aspects.

<u>Vegetation Description</u>: The tree canopy is co-dominated by *Abies lasiocarpa* and *Picea engelmannii* and contains *Pinus albicaulis* and *Pinus contorta* in the canopy. The shrub layer is patchy but dense and co-dominated by *Phyllodoce empetriformis* and *Vaccinium scoparium*. Herbaceous species are rare to absent. Lichens are common.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is not represented in the current data set of vegetation plots in national parks in Washington. This is a recommended name change for the NatureServe association *Abies lasiocarpal Phyllodoce empetriformis* (CEGL000920).

Conservation Rank: S3S4

Rank Justification: This association occurs within a restricted range with few threats. Climate change will likely effect this vegetation.

Photo Not Available

Abies lasiocarpa-(Abies amabilis)/Menziesia ferruginea Forest

Subalpine Fir-(Pacific Silver Fir)/Fool's Huckleberry Forest

Acronym: ABILAS-(ABIAMA)/MENFER

NatureServe Code: Provisional

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest

and Tree Island Group

Alliance: Abies amabilis-Abies lasiocarpa Forest and

Woodland

Classification Confidence Level: 3

<u>Range</u>: This association occurs in the North Cascades. <u>Plots</u>: 2, MORA (0), NOCA (2), OLYM (0), Other (0)

<u>Environmental Description</u>: This association occurs at subalpine elevations on sites that tend to be moist and well-drained and with more "continental" climate than average for the elevation.

Vegetation Description: The canopy is dominated or co-

dominated by *Abies lasiocarpa* with *Abies amabilis* or *Picea engelmannii* prominent to co-dominant. The well-developed shrub layer is dominated or co-dominated by *Menziesia ferruginea* and *Vaccinium membranaceum*. The herb layer is rather variable with only *Valeriana sitchensis* prominent in both stands.

USFWS Wetland System: Not applicable.

<u>Comments</u>: The plots assigned to this type may represent variation within the *Abies amabilis/Menziesia ferruginea* (CEGL000224) association in the Cascades and Coast Ranges. That association differs by having much less *Abies lasiocarpa* and more *Tsuga heterophylla*.

Conservation Rank: S2Q

<u>Rank Justification</u>: This association has a provisional classification status represented by only two locations that are protected in the National Park system.

Abies lasiocarpa-(Abies amabilis)/Vaccinium membranaceum/Valeriana sitchensis Forest

Subalpine Fir-(Pacific Silver Fir)/Big Huckleberry/Sitka Valerian Forest

Acronym: ABILAS-(ABIAMA)/VACMEM/VALSIT

NatureServe Code: CEGL002612

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest

and Tree Island Group

Alliance: Abies amabilis-Abies lasiocarpa Forest and

Woodland

Classification Confidence Level: 2

Range: This association occurs in the Cascades and in the

northeastern Olympic Mountains.

Plots: 52, MORA (24), NOCA (12), OLYM (10), Other (6)

Environmental Description: This association occurs at relatively high elevations and usually in relatively dry climatic zones. Sites have well-drained soils and usually southern

aspects.

Vegetation Description: Abies lasiocarpa dominates or co-

dominates in a forest with a semi-open to closed tree canopy. *Abies amabilis* is usually present as the dominant regenerating tree and occasionally is co-dominant in the canopy. *Picea engelmanii* is sometimes prominent to co-dominant. The shrub layer is typically moderate in density and dominated by *Vaccinium membranaceum*. *Sorbus sitchensis* and *V. deliciosum* are frequent. Occasionally shrubs are only sparsely represented. The well-developed, diverse, and variable herbaceous layer almost always has *Valeriana sitchensis* prominent to co-dominant. *Rubus lasiococcus*, *Arnica latifolia* and *Veratrum viride* are usually present to co-dominant. *Clintonia uniflora*, *Rubus pedatus*, *Tiarella trifoliata*, *Luzula glabrata* var. *hitchcockii* and *Erythronium montanum* are less frequent but can be prominent to co-dominant.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This type differs from *Abies lasiocarpal Valeriana sitchensis* (CEGL000345) by having a greater abundance of *Vaccinium membranaceum* and *Abies amabilis* and a more diverse flora. One plot at North Cascades (NCF-54) is dominated by *Vaccinium membranaceum* and *Linnaea borealis* without *Valeriana sitchensis* or *Arnica latifolia*. It is similar to this association due to the presence of *Abies amabilis*, *Tsuga mertensiana*, other mesic indicators and the absence of high elevation or east Cascades species. It is in the stand table as ABILAS-(PSEMEN)/VACMEM.

Conservation Rank: S4

<u>Rank Justification</u>: Many natural-origin stands occur on protected lands. Some non-protected stands are subject to logging and development.

NatureServe Code: Preliminary

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest

and Tree Island Group

Alliance: Abies amabilis-Abies lasiocarpa Forest and

Woodland

Classification Confidence Level: 2

Range: This association occurs at Mount Rainier and in the

northern and eastern Olympic Mountains.

<u>Plots</u>: 16, MORA (11), NOCA (0), OLYM (5), Other (0)
<u>Environmental Description</u>: This association occurs at middle to high elevations. Sites occupied are dry, usually on mid to upper slopes or ridgetops, with shallow or rocky soils

and southerly aspects.

<u>Vegetation Description</u>: The typically open canopy is

dominated by Abies Iasiocarpa (always over 10% total cover) and A. amabilis or A. procera. Cupressus (=Chamaecyparis) nootkatensis or Pseudotsuga menziesii may be prominent in the canopy. The shrub layer always has Vaccinium membranaceum, which usually is dominant. The well-developed herb layer is dominated by Xerophyllum tenax, often with Rubus Iasiococcus, Orthilia (=Pyrola) secunda, Lupinus (arcticus ssp. subalpinus, Iatifolius) or Vaccinium scoparium

USFWS Wetland System: Not applicable.

<u>Comments</u>: This is similar to *Abies amabilis-(Pseudotsuga menziesii-Abies procera)/Vaccinium membranaceum/ Xerophyllum tenax* Forest (CEGL000239) but is found on colder sites.

Conservation Rank: S2S4Q

<u>Rank Justification</u>: This association has a preliminary classification status and apparently represented at many sites in protected areas.

Synonyms:

Abies amabilis/Xerophyllum tenax Association, Tsuga mertensiana Phase; Franklin et al. 1988 Abies amabilis/Xerophyllum tenax Lithosol Association; Franklin 1966

Abies lasiocarpa/Erythronium montanum Forest

Subalpine Fir/Avalanche Lily Forest

<u>Acronym</u>: ABILAS/ERYMON <u>NatureServe Code</u>: Provisional

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest

and Tree Island Group

Alliance: Abies amabilis-Abies lasiocarpa Forest and

Woodland

Classification Confidence Level: 3

Range: This association is described only from the Olympic

Mountains.

Plots: 4, MORA (0), NOCA (0), OLYM (4), Other (0)

Environmental Description: This association occurs at elevations of 1400-1800 m (4600-6000 ft) on 20-55% slopes

with south to southeast aspects.

<u>Vegetation Description</u>: *Abies lasiocarpa* always dominates (mean cover 60%) with *Tsuga mertensiana* or

Cupressus (=Chamaecyparis) nootkatensis sometimes prominent. A shrub layer is largely absent: Vaccinium membranaceum was present with less than 5% cover. The lush herbaceous understory is dominated by the forb Erythronium montanum (mean cover 50%). Rubus lasiococcus, Polygonum bistortoides, Lupinus (arcticus ssp. subalpinus, latifolius), and Juncus parryi can infrequently be prominent to co-dominant.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This provisional type might be included within the variation of the *Abies lasiocarpal Valeriana sitchensis* association (CEGL000345), but more data are needed.

Conservation Rank: S2Q

<u>Rank Justification</u>: This provisional association occurs within a limited range with few threats. Climate change will likely affect this vegetation type.

Abies lasiocarpa/Rhododendron albiflorum/Rubus lasiococcus Forest

Subalpine Fir/Cascade Azalea/Dwarf Bramble Forest

<u>Acronym</u>: ABILAS/RHOALB/RUBLAS <u>NatureServe Code</u>: PNWCOAST_030

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest and Tree Island

Group

Alliance: Abies amabilis-Abies lasiocarpa Forest and Woodland

Classification Confidence Level: 2

Range: This association occurs in the northeastern Olympics and in the Cascades, including northeastern Mount Rainier.

Plots: 9, MORA (3), NOCA (0), OLYM (6), Other (0)

Environmental Description: This forest or woodland association occurs at high elevations (1400-1820 m (4600-6000 ft)). Sites are usually near avalanche chutes or on slopes with northwestern to eastern aspects with well-drained, shallow soils.

<u>Vegetation Description</u>: The canopy is dominated by *Abies lasiocarpa* with <u>Cupressus (=Chamaecyparis) nootkatensis</u> as a frequent co-dominant. Pinus contorta and Pseudotsuga menziesii have been recorded as codominants outside the parks. Abies lasiocarpa usually dominates tree regeneration and always has over 10% total cover. The moderate to dense shrub layer is dominated by Rhododendron albiflorum, with Vaccinium membranaceum usually present and occasionally co-dominant. Paxistima (=Pachistima) myrsinites is very frequent. The herb layer is sparse to

moderately dense and is usually co-dominated by Rubus lasiococcus. Xerophyllum tenax occasionally co-dominates.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association differs from the similar east Cascades and Rocky Mountain association *Abies lasiocarpal Rhododendron albiflorum* (CEGL000330) by greater cover of *Rubus lasiococcus, Cupressus nootkatensis* and *Lupinus (arcticus, latifolius*), and little to no *Picea engelmannii, Vaccinium scoparium*, and *V. myrtillus*. One Olympic plot (OCF-40) at 1250 m (4100 ft) elevation and co-dominated by *Phyllodoce empetriformis* is considered a variant of this association following Henderson et al. (1989). The plot appears as ABILAS/RHOALB/PHYEMP in the stand tables.

Conservation Rank: S3

Rank Justification: Natural-origin stands occur on protected lands and few are subject to logging and development.

Synonyms:

Abies lasiocarpal Rhododendron albiflorum Association; Henderson et al. 1989 Abies lasiocarpal Rhododendron albiflorum/Rubus lasiococcus Forest; Chappell 2005 NPK Abies lasiocarpal Rhododendron albiflorum-NWW; Henderson et al. 1989

Abies lasiocarpa/Vaccinium membranaceum/Lupinus (arcticus ssp. subalpinus,latifolius) Woodland

Subalpine Fir/Big Huckleberry/Lupine Woodland

Acronym: ABILAS/VACMEM/LUPARC
NatureServe Code: PNWCOAST_032

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest

and Tree Island Group

Alliance: Abies amabilis-Abies lasiocarpa Forest and

Woodland

Classification Confidence Level: 2

Range: This association occurs in the northern and eastern Olympic Mountains and northern and eastern slopes of Mount Rainier.

Plots: 5, MORA (2), NOCA (0), OLYM (3), Other (0)

Environmental Description: This woodland or open forest association occurs at high elevations. Sites are mostly on southeastern-facing slopes on shallow well-drained soils.

Vegetation Description: The canopy is usually dominated

by Abies lasiocarpa or co-dominated by that species and Pseudotsuga menziesii. Abies lasiocarpa usually dominates tree regeneration and always has over 10% total cover. Pinus contorta is occasionally prominent. The typically well-developed shrub layer is dominated by Vaccinium membranaceum. Paxistima (=Pachistima) myrsinites is always present and often prominent. The herb layer ranges from sparse to dense and always has Lupinus (arcticus ssp. subalpinus, latifolius). Xerophyllum tenax can occur as a dominant. Other frequent species are Achillea millefolium, Juncus parryii, Hieracium albiflorum, and Phlox diffusa.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Stands with low cover of *Vaccinium membranaceum* and low cover of herbs are included. This association differs from the *Abies lasiocarpa - Picea engelmannii/ Vaccinium membranaceum* Rocky Mountain (CEGL0000341) association in the east Cascades by the presence of *Lupinus (arcticus* ssp. *subalpinus, latifolius)*, and the lack or low abundance of more east Cascades indicators such as *Picea engelmannii*, *Vaccinium scoparium*, and *Calamagrostis rubescens*.

Conservation Rank: S3

<u>Rank Justification</u>: Natural-origin stands occur on protected lands within a restricted range. Climate change will like effect this vegetation.

and Tree Island Group

Alliance: Abies amabilis-Abies lasiocarpa Forest and

Woodland

Classification Confidence Level: 3

Range: This is described from one plot in the Olympic

Mountains.

Plots: 1, MORA (0), NOCA (0), OLYM (1), Other (0)

Environmental Description: This plot is located at 1660m

(5450ft) elevation on a 36% valley wall slope.

<u>Vegetation Description</u>: Tree cover is 13%. Total shrub cover is near 50% and is co-dominated by short *Abies lasiocarpa* (20% cover), and *Vaccinium alaskaense*, *Sorbus*

sitchensis and Spiraea splendens (=densiflora), each contributing 8% cover. Several herbaceous species,(e.g. Lupinus (arcticus ssp. subalpinus, latifolius)) occur but with low percent cover.

<u>Comments</u>: This vegetation type is a provisional association that may be more appropriately included as a shrub association. An Olympic plot appears in the table as SORSIT-ALNVIR and represents a similar type of vegetation as this one in avalanche tracks but without *Abies lasiocarpa*.

Conservation Rank: S2Q

Rank Justification: This provisional association occurs within a limited range with few threats.

Abies lasiocarpa/Valeriana sitchensis Forest

Subalpine Fir/Sitka Valerian Forest

Acronym: ABILAS/VALSIT

NatureServe Code: CEGL000345

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest

and Tree Island Group

Alliance: Abies amabilis-Abies lasiocarpa Forest and

Woodland

Classification Confidence Level: 2

Range: This association occurs in the Cascade Range and

northeastern Olympic Mountains.

Plots: 19, MORA (8), NOCA (3), OLYM (8), Other (0)

Environmental Description: This association occurs at elevations between 1400-2000 m (4600-6600ft). It is most common in the rainshadows of the coast ranges. Sites have

well-drained soils and southerly aspects.

Vegetation Description: This is a conifer forest or

woodland of relatively short stature. Abies lasiocarpa is always dominant and typically forming a partially open canopy. This type can occur as tree islands in subalpine parkland settings. Small amounts of Tsuga mertensiana or Abies amabilis may sometimes occur in the tree regeneration layer. Cupressus (=Chamaecyparis) nootkatensis or Picea engelmannii may be locally abundant. A shrub layer is largely absent. The relatively lush herbaceous understory is dominated by Valeriana sitchensis and sometimes Rubus lasiococcus, or the graminoid Luzula glabrata var. hitchcockii. Other frequent understory species that typically occur in low abundance are Arnica latifolia, Veratrum viride, Viola orbiculata, Lupinus (arcticus ssp. subalpinus, latifolius), Polemonium pulcherrimum, Pedicularis racemosa, and Ligusticum grayi.

<u>Comments</u>: This association is distinguished from similar associations by having over 5% cover of *Valeriana sitchensis*, *Arnica latifolia*, *or Rubus lasiococcus*, along with little to no *Abies amabilis*, *Tsuga heterophylla*, *Tsuga mertensiana*, *Rhododendron albiflorum* (under 10%), *Vaccinium membranaceum* (under 5%), *Vaccinium scoparium*, or *Phyllodoce empetriformis*. Several plots are included here with low herbaceous cover (generally less than 25%) and with the indicator species between 1 and 5% cover. *Abies lasiocarpa-Picea engelmanniil Valeriana sitchensis* (CEGL005823) has less than 1% *Luzula glabrata var. hitchcockii* and no *Vaccinium deliciosum*. This association broadly overlaps with other moist forb *Abies lasiocarpa* associations in the east Cascades and interior British Columbia.

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs within a restricted range with few threats. Climate change will likely effect this vegetation.

west aspects.

<u>Vegetation Description</u>: Pseudotsuga menziesii var.

menzeisii and Abies lasiocarpa are dominants in the semi-open to closed tree canopy. Tree regeneration most commonly consists of Abies lasiocarpa although Abies amabilis and Cupressus (=Chamaecyparis) nootkatensis regeneration may occur as well. The shrub layer is typically moderately dense and is dominated by the Mahonia (=Berberis) nervosa, with Vaccinium membranaceum and Rosa gymnocarpa present. The undergrowth layer can be abundant and includes mesic-site species such as Achlys (californica, triphylla), Chimaphila umbellata Clintonia uniflora, Linnaea borealis Streptopus lanceolatus (=roseus), Tiarella trifoliata and Orthilia (=Pyrola) secunda. The forest floor can have abundant moss cover.

USFWS Wetland System: Not applicable.

<u>Comments</u>: One plot (OCF-68) of this preliminary type occurs on a toe slope and lacks *Mahonia* (=Berberis) nervosa but otherwise has a similar understory. The provisional *Abies lasiocarpa-Cupressus nootkatensis* Mahonia nervos/Valeriana sitchensis association is similar but differs in being co-dominated by *Cupressus nootkatensis* with sparse understory.

Conservation Rank: S2Q

Rank Justification: This association has a preliminary classification status and is represented at few sites on protected areas.

Abies lasiocarpa Krummholz Shrubland

Subalpine Fir Krummholz Shrubland

<u>Acronym</u>: KRUMM ABILAS <u>NatureServe Code</u>: Provisional

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest

and Tree Island Group

<u>Alliance</u>: Abies lasiocarpa-Tsuga mertensiana-Abies amabilis-Cupressus nootkatensis Krummholz

Classification Confidence Level: 3

Range: This association occurs in the Olympic and Cascade Mountains.

Plots: 5, MORA (3), NOCA (0), OLYM (1), Other (1)

<u>Environmental Description</u>: This association occurs at high elevations. Sites are located at the upper edge of the subalpine parkland and the lower edge of the alpine zone. Soils are well-drained.

Vegetation Description: The vegetation is dominated by

shrub-form *Abies lasiocarpa*. Upright trees are absent or limited to occasional "flag" stems. Associated understory species are variable. Usually this vegetation occurs as well-defined patches near upper treeline. Understory species are mostly those typical of subalpine meadows: *Phyllodoce empetriformis*, *Lupinus (arcticus ssp. subalpinus, latifolius)*, *Vaccinium deliciosum*, and *Vaccinium scoparium*. Alpine krummholz sites are shorter, more sparsely vegetated and contain species such as *Juniperus communis*, *Phyllodoce glanduliflora*, and *Cassiope mertensiana*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Two legacy krummholz plots in the Olympics are co-dominated by *Cupressus* (=Chamaecyparis) nootkatensis and are listed in the table as KRUMM CUPNOO. They are considered variants of the *Abies lasiocarpa* krummholz provisional association. This provisional association differs from *Abies lasiocarpa-Picea englemanni* Krummholz (CEGL000985) in having a presence of Cascadian species such as *Cupressus nootkatensis* and *Vaccinium deliciosum*.

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs within a restricted range and ecological amplitude in Washington with few threats. Climate change may affect this vegetation.

<u>Acronym</u>: KRUMM TSUMER <u>NatureServe Code</u>: Provisional

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest

and Tree Island Group

<u>Alliance</u>: Abies lasiocarpa-Tsuga mertensiana-Abies amabilis-Cupressus nootkatensis Krummholz

Classification Confidence Level: 3

<u>Range</u>: This shrubland association occurs in the Olympic and Cascade Mountains, except in the rainshadow areas of the northeastern Olympics and northeastern parts of Mount Rainier.

Plots: 3, MORA (1), NOCA (0), OLYM (2), Other (0)

Environmental Description: This shrubland association occurs near upper treeline in the upper subalpine parkland and the lower alpine zones.

<u>Vegetation Description</u>: This conifer shrubland occurs as small patches of wind-blasted shrub-form (krummholz) trees dominated by *Tsuga mertensiana*. Other high elevation tree species may also occur in lesser amounts. Associated shrubs, dwarf-shrubs and herbs are somewhat variable. *Vaccinium deliciosum*, *V. membranaceum*, *Phyllodoce empetriformis*, and *Cassiope mertensiana* are frequent.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S3S4

<u>Rank Justification</u>: This occurs within a restricted geographic range and ecological amplitude in Washington with few threats. Climate change may affect this vegetation.

Cupressus nootkatensis/Oplopanax horridus-(Alnus viridis ssp. sinuata) Woodland

Alaska yellow-cedar/Devil's-club-(Sitka Alder) Woodland

Acronym: CUPNOO/OPLHOR-(ALNVIR)

NatureServe Code: Provisional

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest and Tree Island Group

Alliance: Cupressus nootkatensis Forest and Woodland

Classification Confidence Level: 2

Range: This association occurs in the western Cascades and Olympic Mountains.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This association occurs at middle elevations. Sites are typically steep avalanche chutes with subirrigated moist to wet soils.

<u>Vegetation Description</u>: The vegetation type generally consists of an open canopy of short-statured trees, sometimes no taller than the abundant shrubs. The tree component is dominated by *Cupressus* (=Chamaecyparis) nootkatensis. Abies

amabilis is usually present and sometimes co-dominant. Tsuga mertensiana and Abies lasiocarpa also occur occasionally. The generally dense shrub layer is usually dominated by Oplopanax horridus, Acer circinatum, and/or Alnus viridis ssp. sinuata. Oplopanax horridus has over 5% cover. Commonly occuring herbs include Athyrium filix-femina, Tiarella trifoliata var. unifoliata, and Viola glabella.

USFWS Wetland System: Palustrine.

<u>Comments</u>: This type is not represented in the current dataset of vegetation plots for national parks in Washington. This type may be merged with other *Cupressus nootkatensis* avalanche and debris chutes types (e.g. CUPNOO/STRLAN).

Conservation Rank: S3?

<u>Rank Justification</u>: This association occurs within a narrow range of environments that are restricted to the mountains of the coastal Pacific Northwest. There are few threats associated with this type.

Synonyms:

<u>Acronym</u>: CUPNOO/RIBLAC <u>NatureServe Code</u>: Provisional

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest and Tree Island Group

Alliance: Cupressus nootkatensis Forest and Woodland

Classification Confidence Level: 3

Range: This association is described from one plot in the Olympic Mountains.

Plots: 1, MORA (0), NOCA (0), OLYM (1), Other (0)

Environmental Description: The plot defining this type is located on a steep

valley wall at 1177 m (3844 ft) elevation.

<u>Vegetation Description</u>: This is a forest of *Cupressus (=Chamaecyparis)* nootkatensis with some *Abies lasiocarpa* and *Abies amabilis. Alnus viridis* ssp. sinuata dominated avalanche chutes surround this forest. It has an extremely

diverse understory of forbs and shrubs. *Ribes lacustre, Rubus spectabilis, Rubus parviflorus* and *Vaccinium membranaceum* are prominent. *Tiarella trifoliata, Athyrium filix-femina, Prosartes (=Disporum) hookeri, Maianthemum (=Smilacina) racemosum, Polystichum munitum* and *Viola sempervirens* are prominent forbs in this community.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This provisional association may be an outlier representing a unique forest or a variant of avalanche track vegetation with a taller forest structure.

Conservation Rank: S3S5Q

<u>Rank Justification</u>: This provisional association occurs within a narrow range of environments that are restricted to the mountains of the coastal Pacific Northwest. There are few threats associated with this type.

Cupressus nootkatensis/Streptopus lanceolatus var. curvipes Forest

Alaska yellow-cedar/Rosy twistedstalk Forest

<u>Acronym</u>: CUPNOO/STRLAN **NatureServe Code**: Provisional

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest and Tree Island

Group

Alliance: Cupressus nootkatensis Forest and Woodland

Classification Confidence Level: 3

Range: This association occurs in the Olympic and Cascade Mountains.

Plots: 2, MORA (0), NOCA (1), OLYM (1), Other (0)

Environmental Description: This association was sampled on south-facing valley walls at 1160-1465 m (3800-4800 ft). It is found on relatively steep (42-70%) unstable slopes or talus.

<u>Vegetation Description</u>: The open tree canopy consists of *Cupressus* (=Chamaecyparis) nootkatensis in tree or shrub form. A diverse herb layer includes, *Clintonia uniflora*, *Viola glabella*, *Streptopus lanceolatus* (=roseus), *Rubus pedatus* and the fern *Cryptogramma acrostichoides* (=crispa). The shrubs *Frangula purshiana*, *Acer circinatum* and *Paxistima* (=Pachistima) myrsinites occur much less abundantly than *Cupressus nootkatensis* in the understory. Mosses and exposed rocks are common ground cover.

USFWS Wetland System: Not applicable.

Comments: This may represent variation within a generalized avalanche

chute type or a variant of the Abies amabilis-Tsuga mertensianal Streptopus lanceolatus var. curvipes Forest (CEGL000125).

Conservation Rank: S2S3Q

<u>Rank Justification</u>: This provisional association occurs within a narrow range of environments that are restricted to the mountains of the coastal Pacific Northwest. There are few threats associated with this type.

Classification Confidence Level: 3

Range: This association is described from one plot at North

Cascades National Park.

Plots: 1, MORA (0), NOCA (1), OLYM (0), Other (0)

<u>Environmental Description</u>: The plot defining this type occurs at 1025 m (3370 ft) elevation on a 60%, south facing

slope.

<u>Vegetation Description</u>: This closed canopy association is co-dominated by a *Cupressus* (=Chamaecyparis)

nootkatensis and Pseudotsuga menziesii in the tree canopy.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S2S3Q

<u>Rank Justification</u>: This provisional association occurs within a very narrow range of environments that are restricted to the mountains of the coastal Pacific Northwest.

Abies amabilis-Tsuga mertensiana/Menziesia ferruginea Forest

Pacific Silver Fir-Mountain Hemlock/Fool's Huckleberry Forest

<u>Acronym</u>: ABIAMA-TSUMER/MENFER <u>NatureServe Code</u>: PNWCOAST_017

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest

and Tree Island Group

Alliance: Tsuga mertensiana-Abies amabilis Forest and

Woodland

Classification Confidence Level: 1

<u>Range</u>: This association occurs at Mount Rainier and in the eastern portion of North Cascades.

Plots: 10, MORA (7), NOCA (2), OLYM (0), Other (1)

Environmental Description: This association occurs at middle to high elevations. Sites tend to be slopes with northern aspects or benches, and soils are relatively moist.

<u>Vegetation Description</u>: The canopy is typically codominated by *Abies amabilis* and *Tsuga mertensiana*. The

latter has over 10% total cover and the former usually dominates tree regeneration. *Tsuga heterophylla* and *Cupressus* (=Chamaecyparis) nootkatensis are sometimes present to prominent. The well-developed shrub layer is usually co-dominated by *Menziesia ferruginea* and either *Vaccinium membranaceum* or *V. alaskaense*, or both. *V. membranaceum* is almost always present and *Sorbus sitchensis* is frequent. *V. ovalifolium* is occasionally prominent. The herb layer is variable in density and rather species-poor. *Rubus lasiococcus* and *R. pedatus* are usually present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: At Mount Rainier, *Erythronium montanum* sometimes dominates a well-developed herb layer under the shrub layer.

Conservation Rank: S4

Rank Justification: Many natural-origin stands occur on protected lands however some non-protected stands are subject to logging and development.

and Tree Island Group

Alliance: Tsuga mertensiana-Abies amabilis Forest and

Woodland

Classification Confidence Level: 1

Range: This association occurs in the Olympic and western

Cascade Mountains.

Plots: 15, MORA (7), NOCA (0), OLYM (3), Other (5)

Environmental Description: This association occurs in upper montane forest zones. Sites are generally moist but

can be slightly dry.

<u>Vegetation Description</u>: The tree canopy is usually dominated by *Abies amabilis*, and *Tsuga mertensiana* is

always at least prominent to co-dominant. Cupressus (=Chamaecyparis) nootkatensis, Abies lasiocarpa, A. procera, and Pseudotsuga menziesii may be prominent. The shrub layer varies from absent to well-developed. Vaccinium alaskaense or V. membranaceum can be dominant, however the plots sampled in the parks all had sparse shrubs. An herb layer is always present and the characteristic species are Rubus pedatus, Streptopus lanceolatus (=roseus) var. curvipes, and Tiarella trifoliata var. unifoliata. One of the latter two species is always at least prominent in the understory and diagnostic. In the park data, Tiarella trifoliata is the most common herb with Valeriana sitchensis, Rubus lasiococcus and Veratrum viride frequent.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S4

<u>Rank Justification</u>: Many natural-origin stands occur on protected lands however some non-protected stands are subject to logging and development.

<u>Acronym</u>: TSUMER-ABIAMA/Dep. **NatureServe Code**: Preliminary

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest and Tree Island Group

Alliance: Tsuga mertensiana-Abies lasiocarpa Forest and Woodland

Classification Confidence Level: 3

Range: This association occurs in the Cascade and Olympic Mountains.

Plots: 5, MORA (2), NOCA (0), OLYM (3), Other (0)

Environmental Description: This association can be found across a wide range of environments at mid to high elevations (between 910-1550 m (3000 and 5100 ft)). Most stands represent a stagnation phase of stand development following fire.

<u>Vegetation Description</u>: This association consists of stands with a very dense canopy of *Tsuga mertensiana* and often *Abies amabilis* with little to no vascular

plant understory. However, Vaccinium ovalifolium and/or V. alaskense are present in most stands.

USFWS Wetland System: Not applicable.

<u>Comments</u>: These communities are distingushed by a lack plant diversity, understory development and indicator vascular species. However, they are prevalent in all three parks and occupy a large acreage within areas dominated by the North Pacific Maritime Mesic Subalpine Forest, Woodland, & Tree Island Group.

Conservation Rank: S3S5Q

Rank Justification: This provisional association appears to be widespread.

Tsuga mertensiana-Abies amabilis/Vaccinium alaskaense/Maianthemum dilatatum Forest

Mountain Hemlock-Pacific Silver Fir/Alaska Blueberry/False Lily of the Valley Forest

Acronym: TSUMER-ABIAMA/VACALA/MAIDIL

NatureServe Code: CEGL002617

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest and Tree Island Group

Alliance: Tsuga mertensiana-Abies lasiocarpa Forest and Woodland

Classification Confidence Level: 2

Range: This association may occur in the wettest portions of North Cascades or

Olympic National Parks.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This association occurs at middle elevations. It

occupies moist sites on gentle slopes in high precipitation zones.

Vegetation Description: The canopy is co-dominated by Tsuga mertensiana and

Abies amabilis. Tsuga heterophylla, Thuja plicata, and Cupressus

(=Chamaecyparis) nootkatensis are frequent and one or more may be prominent to co-dominant. The well-developed shrub layer is dominated by *Vaccinium alaskaense*, sometimes with *V. ovalifolium* co-dominant. The diverse herb layer is at least co-dominated by *Maianthemum dilatatum*. Other frequently occurring species are *Rubus pedatus*, *Clintonia uniflora*, *Cornus unalaschkensis* (=canadensis), *Blechnum spicant*, and *Streptopus lanceolatus* (=roseus) var. curvipes.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This type is currently known only from Mount Baker-Snoqualmie National Forest and is not represented in the current dataset of vegetation plots for national parks in Washington.

Conservation Rank: S3

Rank Justification: This association occurs within a limited environmental and geographic range in Washington.

Tsuga mertensiana-Abies lasiocarpa/Alnus viridis ssp. sinuata Woodland

Mountain Hemlock-Subalpine Fir/Sitka Alder Woodland

Acronym: TSUMER-ABILAS/ALNVIR

NatureServe Code: Provisional

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest and Tree Island Group

Alliance: Tsuga mertensiana-Abies lasiocarpa Forest and Woodland

Classification Confidence Level: 3

Range: The plot defining this type is at Mount Rainier. **Plots**: 1, MORA (1), NOCA (0), OLYM (0), Other (0)

Environmental Description: The plot is located on a 42% slope.

<u>Vegetation Description</u>: This association has a very open tree canopy (14% cover) of *Abies lasiocarpa* and *Tsuga mertensiana* with a dense shrub layer of *Alnus viridis* ssp. *sinuata* layer. Shorter shrubs *Cassiope mertensiana* and *Rhododendron albiflorum* are present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This provisional type may be related to either the *Abies lasiocarpa - Picea engelmannii / Alnus viridis* ssp. *sinuata* Forest (CEGL000297) in the Northern Rockies or the *Tsuga mertensiana / Alnus viridis* ssp. *sinuata* (CEGL003243) in Alaska. It could also possibly be a variant of the *Alnus viridis* ssp. *sinuata* shrubland (CEGL001154).

Conservation Rank: SUQ

Rank Justification: Insufficient information exists to rank this provisional association.

Tsuga mertensiana-Abies amabilis-(Cupressus nootkatensis)/Elliottia pyroliflorus-Vaccinium membranaceum Woodland

Mountain Hemlock-Pacific Silver Fir/(Alaska yellow-cedar)/Copperbush-Big Huckleberry Woodland

Acronym: TSUMER-ABIAMA/(CUPNOO)/ELLPYR-VACMEM

NatureServe Code: CEGL000503

Macrogroup: Vancouverian Subalpine Forest

Group: North Pacific Mountain Hemlock - Silver Fir Forest and Tree Island Group

Alliance: Tsuga mertensiana-Abies lasiocarpa Forest and Woodland

Classification Confidence Level: 2

Range: This association occurs in the northwestern Cascade Range and may

occur in the national parks.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This woodland association occurs in very wet climatic areas. In Washington, it occurs at elevations of 910-1525 m (3000-5000 ft), primarily on north-facing slopes, mid to upper slopes, and on shallow soils.

Vegetation Description: The relatively short tree canopy is dominated by Tsuga

mertensiana, which averages 40% cover. Abies amabilis is always present in smaller amounts, and Cupressus (=Chamaecyparis) nootkatensis is usually prominent or co-dominant. The understory is dominated by a relatively dense layer of deciduous broad-leaved shrubs, mostly Vaccinium alaskaense and Elliottia (=Cladothamnus) pyroliflorus, and to a lesser degree Vaccinium membranaceum and Menziesia ferruginea. The dwarf-shrubs Phyllodoce empetriformis and Vaccinium deliciosum are sometimes present and occasionally prominent, mostly at the upper elevational limits of the type. The herbaceous layer is dominated by Rubus pedatus and Blechnum spicant, each averaging about 10% cover.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is distinguished from similar associations by over 5% cover of *Elliottia pyroliflorus* and low cover of wet site indicators such as *Caltha leptosepala* (=biflora, leptosepala) or *Oplopanax horridus*. This type is not represented in the current dataset of vegetation plots for national parks in Washington

Conservation Rank: G5S2

Rank Justification: This association occurs within a limited environmental and geographic range in Washington.

Group

Alliance: Tsuga mertensiana-Abies lasiocarpa-Cupressus nootkatensis

Tree Island

Classification Confidence Level: 2

Range: This association occurs in the Olympic and the Cascade Mountains.

Plots: 6, MORA (0), NOCA (1), OLYM (5), Other (0)

Environmental Description: This association occurs at high elevations as

tree islands in the subalpine parkland.

<u>Vegetation Description</u>: The tree canopy is dominated by *Abies lasiocarpa*. *Cupressus* (=Chamaecyparis) nootkatensis can be co-dominant. There are few to no shrubs and if present they typically have less than 5% cover. The herb layer usually includes *Polemonium pulcherrimum*, *Pedicularis racemosa*, *Polygonum bistortoides*, and/or *Luzula glabrata* var.

hitchcockii.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Abies lasiocarpa parklands with a sparse understory of Valeriana sitchensis and/or Arnica latifolia may best fit this concept. This

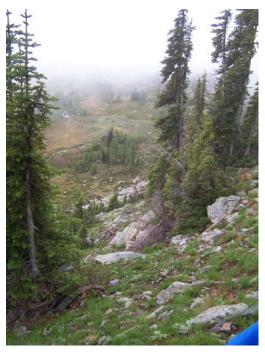

differs from the *Abies lasiocarpa-Picea engelmanniil Polemonium pulcherrimum* (CEGL000373) by presence to prominence of more Cascadian species such as *Cupressus nootkatensis* and *Luzula glabrata* var. *hitchcockii* and low abundance or absence of *Picea engelmannii*.

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs within a limited ecological range but with few threats. Climate change will likely effect this vegetation.

<u>Acronym</u>: CUPNOO/VACDEL **NatureServe Code**: Provisional

Macrogroup: Vancouverian Subalpine Forest

<u>Group</u>: North Pacific Mountain Hemlock - Silver Fir Forest and Tree Island Group **Alliance**: *Tsuga mertensiana-Abies lasiocarpa-Cupressus nootkatensis* Tree

Island

Classification Confidence Level: 3

Range: This association is described from one plot in the Olympic Mountains.

Plots: 1, MORA (0), NOCA (0), OLYM (1), Other (0)

Environmental Description: The plot defining this type is at 1740 m (5700 ft)

elevation on a east-facing, 50% slope.

<u>Vegetation Description</u>: This is a small open stand dominated by *Cupressus* (=Chamaecyparis) nootkatensis trees in a subalpine parkland setting. Vaccinium

deliciosum dominates the understory with *Ribes acerifolium* and *Phyllodoce empetriformis* present in lesser amounts. The herbaceous layer contains species common to subalpine environments such as *Valeriana sitchensis*, *Polygonum bistortoides*, *Erythronium montanum*, and *Carex spectabilis*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is very similar to the *Tsuga mertensianal Phyllodoce empetriformis-Vaccinium deliciosum* association (PNWCOAST_286) and might best be described as a variant of that association but with a different tree component. This association could be included within the *Cupressus nootkatensis* Subalpine Parkland Woodland (CEGL000350; Stand Group 9; Antos and Zobel 1986) association.

Conservation Rank: S2S4

<u>Rank Justification</u>: This provisional association may represent a narrowly defined type. Climate change will likely affect this vegetation.

Tsuga mertensiana/Phyllodoce empetriformis-Vaccinium deliciosum Woodland

Mountain Hemlock/Pink Mountain-heather-Blueleaf Huckleberry Woodland

Acronym: TSUMER/PHYEMP-VACDEL
NatureServe Code: PNWCOAST_286

and Tree Island Group

Alliance: Tsuga mertensiana-Abies lasiocarpa-

<u>Cupressus</u> nootkatensis Tree Island Classification Confidence Level: 2

Range: This association occurs in the western Cascades

and Olympic Mountains.

Plots: 11, MORA (1), NOCA (5), OLYM (4), Other (1)

Environmental Description: This subalpine parkland or woodland association is found at high elevations. It is absent from dry climatic areas including the northeastern Olympics and northeastern Mount Rainier.

Vegetation Description: This association typically forms

a mosaic of tree clumps or small patches of forest or woodland with dwarf-shrub openings. It also occurs as an upper montane woodland just below the subalpine parkland. *Tsuga mertensiana* dominates the tree layer and *Abies amabilis* is usually present to prominent. *Abies lasiocarpa* is usually absent or, if present, is relatively minor in comparison to other trees. The shrubs *Vaccinium alaskaense*, *Rhododendron albiflorum* or *V. membranaceum* are usually present and often have substantial cover around the bases of trees. The dominant understory vegetation is dwarf-shrubs, primarily *Phyllodoce empetriformis* and *Vaccinium deliciosum*, and secondarily *Cassiope mertensiana* and *Luetkea pectinata*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: One related plot from Olympic National Park is tentatively assigned to the provisional *Cupressus nootkatensis /Vaccinium deliciosum* type (CUPNOO/ VACDEL). If additional sampling is conducted, it may be necessary to expand this association's concept or distinguish a new type.

Conservation Rank: S3S4

Rank Justification: This association occurs within a narrow environmental range with few threats. Climate change will likely affect this vegetation.

Classification Confidence Level: 2

Range: This association occurs in the Cascades and Olympic Mountains.

Plots: 40, MORA (9), NOCA (1), OLYM (17), Other (13)

<u>Environmental Description</u>: This subalpine parkland association occurs above continuous forest and below upper treeline. It is absent from the driest climatic areas such as the northeast Olympics and northeastern Mount Rainier. Its typical form is a mosaic of tree clumps, small patches of forest or woodland, and dwarf-shrub openings.

<u>Vegetation Description</u>: The tree canopy is usually dominated by *Abies lasiocarpa* with *Tsuga mertensiana* ranging from dominant to present. *Abies amabilis* is often present. *Cupressus* (=Chamaecyparis) nootkatensis can be present to prominent typically as a tall shrub. The shrubs *Vaccinium membranaceum* and *Rhododendron albiflorum* often occur directly under the trees. The well-developed dwarf-shrub layer is co-dominated by *Vaccinium deliciosum* and *Phyllodoce empetriformis*. The herb layer can include *Luzula*

glabrata var. hitchcockii, Lupinus (arcticus ssp. subalpinus, latifolius), Arnica latifolia, and Valeriana sitchensis.

<u>Comments</u>: One Mount Rainier plot is included here in which *Cupressus nootkatensis* is the dominant tree with *Abies lasiocarpa* and *Tsuga mertensiana* each with over 10% cover in the shrub layer. This is transitional with the provisional *Cupressus nootkatensis/Vaccinium deliciosum* association.

Conservation Rank: S3S4

Rank Justification: This association occurs throughout the high elevations in western Washington.

Synonyms:

Picea engelmannii/Equisetum arvense Forest

Engelmann Spruce/Field Horsetail Forest

<u>Acronym</u>: PICENG/EQUARV <u>NatureServe Code</u>: CEGL005927

Macrogroup: Rocky Mountain and Great Basin Flooded & Swamp Forest

<u>Group</u>: Rocky Mountain Subalpine-Montane Riparian Woodland <u>Alliance</u>: *Picea engelmannii-(Abies lasiocarpa)* Riparian Forest

Classification Confidence Level: 2

Range: This association occurs in the east Cascades and Northern Rockies.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This riparian association tends to occur on low gradient, typically meandering streams. It is located on stream terraces or associated with forested or shrub wetlands along mountain streams between 760-1500m (2500-4900ft) elevation. Soils can be mineral (e.g. loam with deep A horizons) or organic.

Photo Not Available

<u>Vegetation Description</u>: The forest or woodland canopy is usually dominated by *Picea engelmannii* often with *Abies lasiocarpa*. The shrub layer is poorly-developed with occasional patches of *Alnus incana*, *Ribes lacustre* or a wide variety of other riparian shrubs. *Equisetum arvense* is the dominant (over 10% cover) understory species, often growing abundantly with little other forb cover. *Carex disperma* can occasionally be abundant. The variable herb layer usually has one or more of the following: *Maianthemum* (=Smilacina) stellatum, Streptopus amplexifolius, Galium triflorum, or Cornus canadensis.

USFWS Wetland System: Palustrine.

<u>Comments</u>: This type is not represented in the current dataset of vegetation plots for national parks in Washington. It may occur in the headwaters of Lake Chelan.

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs at numerous sites in Washington but is poorly represented on protected areas. Direct and indirect hydrologic changes, such as road construction, can negatively affect occurrences.

Classification Confidence Level: 1

Range: This association occurs in the Cascade Mountains. **Plots**: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This association occurs at middle elevations. Sites include mid to toe slopes, benches, and bottoms, with poorly-drained soils that are subirrigated or associated with springs, seeps, or small streams.

Vegetation Description: The canopy is co-dominated by *Tsuga mertensiana* and *Abies amabilis*. The former has over 10% total cover and the latter usually dominates tree regeneration. The well-developed shrub layer is dominated or co-

dominated by *Vaccinium alaskaense*. *Oplopanax horridus* is always prominent to co-dominant. *Rubus spectabilis* is usually prominent to co-dominant. *Alnus viridis* ssp. *sinuata* is occasionally co-dominant. The herb layer is usually relatively rich. The most abundant species include *Rubus pedatus*, *Clintonia uniflora*, *Tiarella trifoliata* var. *unifoliata*, *Athyrium filix-femina*, and *Gymnocarpium dryopteris*.

USFWS Wetland System: Palustrine.

Comments:

Woodland

Classification Confidence Level: 2

Range: This association occurs on the western Olympic Peninsula.

Plots: 2, MORA (0), NOCA (0), OLYM (2), Other (0)

Environmental Description: This forested wetland association occurs at low elevations. Sites are flat or nearly so and usually occur on riverine terraces or floodplains of low-gradient streams. Soils are poorly drained and typically seasonally flooded.

<u>Vegetation Description</u>: The forest or woodland canopy is always dominated or co-dominated by *Picea sitchensis*. *Alnus rubra* is sometimes co-dominant and *Tsuga heterophylla* can be prominent. The shrub layer ranges from sparse to moderately dense and is characterized by consistent presence of *Rubus spectabilis*, with *Gaultheria shallon* sometimes present. The well-developed herb layer is dominated by *Carex obnupta* and/or *Lysichiton americanus*. *Carex obnupta* is always at least present and usually co-dominant.

USFWS Wetland System: Palustrine.

Group: North Pacific Hardwood-Conifer Swamp

<u>Alliance</u>: (Tsuga heterophylla - Picea sitchensis-Thuja plicata- Abies) / Lysichiton americanus Coniferous Swamp Woodland

Classification Confidence Level:

Range: This forested wetland association occurs in the lowlands throughout western Washington, except perhaps on the outer coastal plain of the Olympic Peninsula.

Plots: 3, MORA (3), NOCA (0), OLYM (0), Other (0)

Environmental Description: This type occurs exclusively on poorly drained sites that are saturated or seasonally flooded. Soils are saturated throughout the growing season and are often organic (muck or woody peat), but may also be mineral.

<u>Vegetation Description</u>: The semi-open to dense forest canopy is dominated by *Tsuga heterophylla*, *Thuja plicata*, and/or *Alnus rubra*. Either *Tsuga heterophylla* or *Thuja plicata* are always at least co-dominant. *Picea sitchensis*, *Pseudotsuga menziesii* or *Abies amabilis* are sometimes present in lesser abundance. Tree regeneration is generally dominated by *Tsuga heterophylla*. The shrub layer varies from sparse to well-developed. *Rubus spectabilis* is usually the most abundant species. *Acer circinatum* is sometimes prominent. The herb layer is well-developed and dominated or co-dominated by *Lysichiton americanus*. *Athyrium filix-femina* is usually present to prominent. The understory is characterized by at least 5% cover of *Lysichiton americanus*, relatively low abundance of *Gaultheria shallon*, and the presence to prominence of *Rubus spectabilis* or *Athyrium filix-femina*.

USFWS Wetland System: Palustrine.

Comments:

Conservation Rank: S2S3

<u>Rank Justification</u>: This association occurs only in wetlands. It is sensitive to changes in hydrology or water quality and to logging disturbance.

NatureServe Code: CEGL000223

Macrogroup: Vancouverian Flooded & Swamp Forest

Group: North Pacific Hardwood-Conifer Swamp

Alliance: Alnus rubra/Lysichiton americanus Swamp Woodland

Classification Confidence Level: 1

Range: This association occurs in the Olympic Mountains and northwestern

Cascade Range.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This forested wetland association occurs at middle elevations (250-900 m (820-2950 ft)). Site are small patches where soils are

saturated and typically organic (especially muck).

Vegetation Description: The canopy is dominated by Tsuga heterophylla, and

usually co-dominated by Abies amabilis and Thuja plicata. Abies amabilis occupies over 10% total cover (understory and canopy). The understory has a moderately dense to open shrub layer, with Vaccinium alaskaense, Oplopanax horridus, and Rubus spectabilis being the major species (only the first is always present). The herb layer is well-developed and Lysichiton americanus typically a co-dominant (always over 5% cover). Many other forbs and ferns may occur, especially Clintonia uniflora, Blechnum spicant, Rubus pedatus, Streptopus lanceolatus (=roseus) var. curvipes, Maianthemum dilatatum, Athyrium filix-femina, and Cornus unalaschkensis (=canadensis).

USFWS Wetland System: Palustrine.

Comments: This association is not represented in the current dataset of vegetation plots for national parks in Washington.

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs in small patches associated with a very specific environment. It is moderately threatened by logging and associated impacts and due to its saturated, organic soils, which are susceptible to physical disturbance and difficult to restore once impacted.

Western Hemlock-Western Redcedar/Salal/Skunkcabbage Forest

Acronym: TSUHET-THUPLI/GAUSHA/LYSAME

NatureServe Code: CEGL003226

Macrogroup: Vancouverian Flooded & Swamp Forest

Group: North Pacific Hardwood-Conifer Swamp

<u>Alliance</u>: (Tsuga heterophylla - Picea sitchensis-Thuja plicata- Abies) / Lysichiton americanus Coniferous Swamp

Woodland

Classification Confidence Level: 2

Range: This association occurs on the western coastal plain of the Olympic Peninsula and on Mount Rainier.

Plots: 5, MORA (3), NOCA (0), OLYM (2), Other (0)

<u>Environmental Description</u>: This forested wetland association (can be a woodland) occurs on organic soils that are poorly drained and composed primarily of muck, with admixture of woody debris and/or woody peat. Topography is flat or gently sloping. Microtopography is typified by raised

areas of large woody debris and lower areas that are wetter and seasonally flooded to saturated.

Vegetation Description: The canopy is dominated by *Thuja plicata* and *Tsuga heterophylla*, with the latter usually dominating the tree understory. *Abies amabilis* and *Picea sitchensis* sometimes occur in the understory (typically the former) or canopy (more the latter) with under 25% cover. *Gaultheria shallon* dominates or co-dominates the shrub layer and is rooted in woody debris. *Vaccinium alaskaense* is usually prominent to co-dominant. Other frequently occuring shrubs are *Vaccinium parvifolium* and *Menziesia ferruginea*. *Vaccinium ovatum* can be locally abundant (particularly adjacent to the outer coast) but is usually absent. The herb layer is characterized by at least 5% cover of *Lysichiton americanus*, growing in the wettest microsites. *Blechnum spicant* is typically prominent to co-dominant. *Cornus unalaschkensis* (=canadensis) and *Rubus pedatus* are usually present.

USFWS Wetland System: Palustrine.

<u>Comments</u>: One plot, the only Mount Rainier location with *Picea sitchensis*, is tentatively included in this type. It is a sub-irrigated site at a higher elevation and with lower cover of *Lysichiton americanus* that is otherwise similar to this association.

Conservation Rank: S2

<u>Rank Justification</u>: This association occurs in small patches associated with a very specific environment. It is moderately threatened by logging and associated impacts and is fragile due to its saturated, organic soils, which are susceptible to physical disturbance and difficult to restore once impacted, and sensitivity to hydrological alterations.

Alliance

Classification Confidence Level: 3

Range: This association is described from one plot in the North Cascades.

Plots: 1, MORA (0), NOCA (1), OLYM (0), Other (0)

Environmental Description: The plot representing this

riparian vegetation occurs on a 25% slope.

<u>Vegetation Description</u>: Acer macrophyllum dominates the closed broadleaf forest canopy. The shrub layer is sparse with *Rubus parviflorus*, *Oplopanax horridus* and *Sambucus*

racemosa present. Maianthemum (=Smilacina) stellatum, Prosartes (=Disporum) hookeri and a Poa species dominate the herbaceous understory.

USFWS Wetland System: Palustrine

<u>Comments</u>: This provisional association may represent a new type or fit within one of several currently recognized associations. Data from focused riparian sampling are needed.

Conservation Rank: S2S4Q

Rank Justification: This association has a provisional classification status and is represented on one site in a protected area.

Acer macrophyllum/Oxalis oregana Forest

Bigleaf Maple/Oregon Oxalis Forest

<u>Acronym</u>: ACEMAC/OXAORE <u>NatureServe Code</u>: Preliminary

<u>Macrogroup</u>: Vancouverian Flooded & Swamp Forest <u>Group</u>: North Pacific Lowland Riparian Forest and

Woodland

Alliance: (Acer macrophyllum, Alnus rubra) Riparian Forest

Alliance

Classification Confidence Level: 2

Range: This type occurs on the Olympic Peninsula.

Plots: 9, MORA (0), NOCA (0), OLYM (9), Other (0)

Environmental Description: This association occurs at elevations generally below 450 m (1500 ft) on flat to low gradient slopes. Sites are moist and located primarily on riparian terraces. It is also found on alluvial fans, toe slopes, and adjacent to wetlands.

<u>Vegetation Description</u>: This broadleaf forest is dominated by *Acer macrophyllum* with conifers present, most frequently *Picea sitchensis*. A tall shrub layer is usually present and is dominated by *Acer circinatum* with *Rubus spectabilis* often present. The lush, species-rich herbaceous understory is dominated by *Oxalis oregana* with *Polystichum munitum* often codominant. *Tolmiea menziesii*, *Claytonia* (=Montia) sibirica, *Circaea alpina* and *Galium aparine* are frequently present to prominent.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association may be a variant of the *Populus balsamifera* ssp. *trichocarpa - Picea sitchensis - (Acer macrophyllum) / Oxalis oregana* association (CEGL003418). The stands with abundant *Acer circinatum* and *Oxalis oregana* included in this type were formerly considered part of the *Acer macrophyllum/Acer circinatum* association (CEGL000560).

Conservation Rank: S3S4

<u>Rank Justification</u>: There are few sites of this association within a limited geographic extent on the western Olympic Peninsula. Exotic species are present in most stands to varying degrees and will probably spread over time.

Acer macrophyllum/Polystichum munitum-Tolmiea menziesii Forest

Bigleaf Maple/Swordfern-Youth-on-age Forest

Acronym: ACEMAC/POLMUN-TOLMEN

NatureServe Code: Preliminary

<u>Macrogroup</u>: Vancouverian Flooded & Swamp Forest

Group: North Pacific Lowland Riparian Forest and

Woodland

Alliance: (Acer macrophyllum, Alnus rubra) Riparian Forest

Alliance

Classification Confidence Level: 3

Range: This association occurs on the Olympic Peninsula and is likely found in the Cascade Mountain foothills.

Plots: 6, MORA (0), NOCA (0), OLYM (6), Other (0)

Environmental Description: This broadleaf forest association occurs on riparian terraces at relatively low elevations (less than 610 m (2000 ft) in plot data).

<u>Vegetation Description</u>: In this association, the overstory canopy is partially to completely closed. *Acer macrophyllum* dominates the overstory, sometimes with *Alnus rubra* which

is always less prominent. The conifers *Abies grandis* and *Pseudotsuga menziesii* can be present and are always less abundant than deciduous trees. *Symphoricarpos albus* is the most frequent shrub with *Acer circinatum*, *Rosa gymnocarpa* or *Rubus spectabilis* less commonly present, typically in patches. *Polystichum munitum* characteristically dominates the understory. *Tolmiea menziesii*, *Carex deweyana*, *Circaea alpina*, *Bromus vulgaris*, *Melica subulata*, *Viola glabella*, or *Galium aparine* are usually present and can be prominent. *Polypodium glycyrrhiza* is usually present as an epiphyte on the *Acer* trees.

USFWS Wetland System: Palustrine.

<u>Comments</u>: There is possible confusion or overlap between this association and the *Acer macrophyllum/Rubus spectabilis* (CEGL000561) association. However, the latter has much greater abundance of *Rubus spectabilis* and/or *Ribes bracteosum*. The *Acer macrophyllum-(Pseudotsuga menziesii)/Polystichum munitum* association (Preliminary) appears on disturbed sites such as debris slides and previously logged upland sites.

Conservation Rank: S3S4

<u>Rank Justification</u>: This preliminary association occurs within a narrow geographic and ecologic range. It is currently recognized as a natural vegetation unit that may be altered by logging.

Acer macrophyllum/Rubus spectabilis Forest

Bigleaf Maple/Salmonberry Forest

<u>Acronym</u>: ACEMAC/RUBSPE <u>NatureServe Code</u>: CEGL000561

Macrogroup: Vancouverian Flooded & Swamp Forest

Forest

Group: North Pacific Lowland Riparian Forest and

Woodland

Alliance: (Acer macrophyllum, Alnus rubra) Riparian Forest

Alliance

Classification Confidence Level: 3

Range: This association occurs in the Cascade and Olympic

Mountains.

Plots: 5, MORA (0), NOCA (1), OLYM (4), Other (0)

<u>Environmental Description</u>: This low elevation to foothill association appears mostly on riparian floodplains, terraces or moist soils (seeps). It can occur on moist upland sites as early seral vegetation.

<u>Vegetation Description</u>: This closed broadleaf forest is dominated by *Acer macrophyllum* with occasional *Alnus rubra*. *Picea sitchensis*, *Tsuga heterophylla* and *Thuja plicata* can be present to prominent but in aggregate never exceeds broadleaf tree cover. *Rubus spectabilis* and/or *Ribes bracteosum* dominates the shrub understory with few other shrub species present. However, *Acer circinatum* can form an upper tall-shrub layer. *Polystichum munitum* and *Tolmiea menziesii* can be prominent to dominant in the herb layer. *Claytonia* (=Montia) sibirica, *Circaea alpina*, *Carex deweyana*, and *Melica subulata* are other frequent herbs.

USFWS Wetland System: Palustrine.

<u>Comments</u>: There is possible confusion or overlap between this association and *Acer macrophyllum /Polystichum munitum-Tolmiea menziesii* (Preliminary) which is characterized by low abundance of *Rubus spectabilis* and other shrubs.

Conservation Rank: S4

<u>Rank Justification</u>: This preliminary association occurs within a narrow geographic and ecologic range. It is currently recognized as a natural vegetation type that may be altered by logging.

Alliance: (Acer macrophyllum, Alnus rubra) Riparian Forest

Alliance

Classification Confidence Level: 2

Range: This type is found in western Washington.

Plots: 1, MORA (1), NOCA (0), OLYM (0), Other (0)

Environmental Description: This association occurs at lower elevations on riparian floodplains, streambanks, or terraces. Soils are somewhat well-drained.

<u>Vegetation Description</u>: The canopy is dominated by *Alnus rubra*. *Acer circinatum* dominates a tall shrub layer though *Rubus spectalilis* and other shrubs may be present.

<u>Comments</u>: The one plot recorded at MORA is transitional to *Alnus rubra/Oplopanax horridus-Rubus spectabilis* (CEGL003399).

Conservation Rank: S4

Rank Justification: This association is, geographically, relatively widespread although limited to riparian and valley bottom habitats.

Synonyms:

Alnus rubra/Acer circinatum community; Diaz & Mellon 1996 Alnus rubra/Acer circinatum/Claytonia sibirica Forest; Chappell 2005 NPK Alnus rubra/Acer circinatum/Polystichum munitum Community Type; Mycek 1994

NatureServe Code: CEGL003398

Macrogroup: Vancouverian Flooded & Swamp Forest

Group: North Pacific Lowland Riparian Forest and Woodland

Alliance: (Acer macrophyllum, Alnus rubra) Riparian Forest Alliance

Classification Confidence Level: 2

Range: This type is found in western Washington.

Plots: 14, MORA (0), NOCA (0), OLYM (14), Other (0)

Environmental Description: This association occurs at low elevations on riparian floodplains and flat, lower terraces. Soils are well-drained due to coarse texture. Cobbles can be common on the soil surface of these sites although often obscured by litter.

<u>Vegetation Description</u>: The canopy is dominated by *Alnus rubra*. In the western Olympics, *Picea sitchensis* is typically in the canopy or sub-canopy. Grasses dominate the understory, and can co-dominate with the trailing dwarf-shrub *Rubus ursinus* (latter situation not found in the parks). *Acer circinatum* occasionally forms a tall-shrub layer. *Elymus glaucus* or *Elymus hirsutus* has over 1% cover and often well over 10%. *Polystichum munitum* is usually present but under 5% cover. *Oxalis oregana*, *Claytonia* (=*Montia*) *sibirica*, *Galium aparine*, *Circaea alpina* and *Tolmiea menziesii* occur frequently. *Agrostis* spp. and *Ranunculus repens* are often abundant. Sites heavily used by elk may lack the full suite of native indicator species but are

still dominated by grasses, such as Poa trivialis, Agrostis exarata, Poa pratensis, or Bromus sitchensis.

USFWS Wetland System: Palustrine.

<u>Comments</u>: This association is broadly defined to include all grass dominated *Alnus rubra* stands with *Elymus glaucus* or *Elymus hirsutus*. It is related to the *Alnus rubra*/*Oxalis* (oregana, trilliifolia) Forest (CEGL003400). The plots with *Acer circinatum* are related to the *Alnus rubra*/*Acer circinatum*/*Claytonia siberica* Forest (CEGL003298).

Conservation Rank: S3S4

Rank Justification: This association receives some protection and occurs in a restricted range and environment.

Alliance

Classification Confidence Level: 2

Range: This association occurs in western Washington.

Plots: 2, MORA (2), NOCA (0), OLYM (0), Other (0)

<u>Environmental Description</u>: This association occurs at lower elevations on riparian floodplains, terraces, and toe slopes. Sites are somewhat poorly drained, usually due to restrictive soil layers perching moving water to create subirrigation.

<u>Vegetation Description</u>: The canopy is dominated by *Alnus rubra*. The understory is dominated or co-dominated by

Oplopanax horridus, which always occupies over 10% cover. Rubus spectabilis and/or Ribes bracteosum often co-dominate in the shrub layer. A diverse and often abundant herbaceous layer is typical. Athyrium filix-femina, Gymnocarpium dryopteris, Oxalis oregana, and Tolmiea menziesii are among the many herbaceous species that are frequently abundant in the understory.

USFWS Wetland System: Palustrine.

Comments:

Classification Confidence Level: 2

Range: This type is found in western Washington.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This association occurs on well-drained soils at lower to middle elevations on riparian floodplains, bars, or low-lying streambanks. These sites are frequently flooded and/or occurs as an early successional vegetation type

Vegetation Description: The canopy is dominated by Alnus rubra which is

sometimes only at shrub height due to its early successional status. The understory is dominated by *Petasites frigidus* although other forbs are typically present. Shrubs (other than shrub-height alder) are under 20% cover if present.

USFWS Wetland System: Palustrine.

<u>Comments</u>: This association is not represented in the current data set of vegetation plots for the national parks in Washington. Sites co-dominated at by *Salix sitchensis* and *Alnus rubra* as tall shrubs are included in *Salix sitchensis/Equisetum arvense-Petasites frigidus* shrubland (CEGL003296).

Conservation Rank: S4

Rank Justification: This association occurs in limited range and environment with few threats.

Abies grandis/Bromus vulgaris-Polystichum munitum Forest

Grand Fir/Columbia brome-Swordfern

Acronym: ABIGRA/BROVUL-POLMUN

NatureServe Code: Provisional

Macrogroup: Vancouverian Flooded & Swamp Forest

Group: North Pacific Lowland Riparian Forest and Woodland

Alliance: (Picea sitchensis, Abies grandis, Tsuga heterophylla, Thuja) - (Alnus,

Acer) Riparian Forest Alliance

Classification Confidence Level: 2

Range: This association occurs in the Olympic Mountains.

Plots: 2, MORA (0), NOCA (0), OLYM (2), Other (0)

Environmental Description: This association is characterized from sites on the east side of the Olympic Mountains.at 470 m (1550 ft) elevation on low gradient slopes in riparian settings.

Vegetation Description: These are likely seral stands with a mixed canopy

dominated or co-dominated by Abies grandis with Acer macrophyllum and/or Alnus rubra. The grasses Bromus vulgaris and Elymus glaucus dominate the undergrowth. Poa trivialis and P. pratensis are prominent. Polystichum munitum, Tolmiea menziesii, Heracleum maximum (=lanatum), Galium aparine, Ranunculus repens, and Adenocaulon bicolor are present in both plots with substantial cover. Shrub cover is sparse with Acer circinatum, Rubus spectabilis, and Ribes lacustre in trace amounts.

USFWS Wetland System: Palustrine.

<u>Comments</u>: More intensive sampling and survey is needed to verify the extent and characteristics of this type. This is not the *Abies grandis/Bromus vulgaris* (CEGL002601) described from the Blue Mountains in Oregon.

Conservation Rank: S2S3Q

Rank Justification: This apparently has a restricted range and ecological amplitude although its classification is tentative.

Synonyms:

Abies grandis/Grass Community Type; Henderson et al. 1979

<u>Alliance</u>: (Picea sitchensis, Abies grandis, Tsuga heterophylla, Thuja) - (Alnus, Acer) Riparian Forest Alliance

Classification Confidence Level: 2

Range: This association occurs in the southern Cascade foothills of Washington including Mount Rainier and on the Olympic Peninsula.

Plots: 7, MORA (1), NOCA (0), OLYM (6), Other (0)

<u>Environmental Description</u>: This association occurs on relatively well-drained soils at lower elevations on riparian terraces, streambanks or floodplains.

Vegetation Description: The canopy is dominated by *Alnus*

rubra. Picea sitchensis or Tsuga heterophylla are frequently in the overstory but with low cover. When present, the tall shrub layer is dominated by Acer circinatum. Rubus spectabilis or Ribes bracteosum may be present but under 20% cover in aggregate. The understory is dominated by Oxalis oregana or Oxalis trilliifolia. Polystichum munitum can be co-dominant or dominant in the herb layer. Many other forbs and ferns, including Athyrium filix-femina, Luzula (fastigiata, parviflora), Tiarella trifoliata, Circaea alpina and Tolmiea menziesii, are frequently present to prominent. Grasses, such as Elymus glaucus and Elymus hirsutus, are present to co-dominant but never dominant or more abundant in aggregate than Oxalis spp.

USFWS Wetland System: Palustrine.

<u>Comments</u>: This association concept has been expanded to include subassociations with a *Acer circinatum*-dominated shrub layer.

Conservation Rank: S3S4

Rank Justification: This association receives some protection and occurs in restricted range and environment.

Synonyms:

Alnus rubra / Oxalis spp.; Diaz & Mellon 1996

<u>Macrogroup</u>: Vancouverian Flooded & Swamp Forest

Group: North Pacific Lowland Riparian Forest and

Woodland

Alliance: (Picea sitchensis, Abies grandis, Tsuga

heterophylla, Thuja) - (Alnus, Acer) Riparian Forest Alliance

Classification Confidence Level: 2

Range: This association occurs on the outer coastal strip of

the Olympic Peninsula.

Plots: 2, MORA (0), NOCA (0), OLYM (2), Other (0)

Environmental Description: Sites are usually on slopes facing the Pacific Ocean or, less frequently, within one mile of the ocean. Soils are somewhat poorly drained and/or subirrigated.

<u>Vegetation Description</u>: The canopy is dominated or co-dominated by *Picea sitchensis* and/or *Alnus rubra*. *Picea sitchensis* is always at least prominent and can be confined to the understory below *Alnus* canopy. *Tsuga heterophylla* is sometimes present to prominent. The dense shrub layer is dominated by *Rubus spectabilis*. *Sambucus racemosa* is frequent and can be prominent. The well-developed herb layer is dominated by *Polystichum munitum*. *Athyrium filix-femina* is sometimes prominent.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This type is similar to *Alnus rubra/Polystichum munitum* (CEGL000638) although the latter lacks prominence of *Picea sitchensis* or other conifers. One atypical plot lacked *Polystichum munitum* and had high cover of *Maianthemum dilatatum*. However, its cover of *Rubus spectabilis* and other floristic affinities places it here rather than with the *Picea sitchensis/Maianthemum dilatatum* association (CEGL003266).

Conservation Rank: S3

Rank Justification: This association is restricted to narrow habitats, in a limited geographic range and currently has few threats.

heterophylla, Thuja) - (Alnus, Acer) Riparian Forest Alliance

Classification Confidence Level: 2

Range: This association occurs in the western Cascades and the Olympic Peninsula except in the wettest part of the western Olympics and on the outer coastal strip.

Plots: 15, MORA (7), NOCA (2), OLYM (6), Other (0)

Environmental Description: This association occurs at low elevations. Sites are usually on lower or toe slopes or riverine terraces. Soils are moist and often deep.

Vegetation Description: The canopy is dominated by a

variable mixture of *Tsuga heterophylla*, *Pseudotsuga menziesii*, and/or *Thuja plicata*. *Tsuga heterophylla* or *Thuja plicata* always occupy at least 10% total cover and dominate tree regeneration. *Acer macrophyllum* or *Alnus rubra* are sometimes prominent. A well-developed tall-shrub layer dominated by *Acer circinatum* is often present. Shorter shrubs are usually sparse but often include *Rubus spectabilis* (an important indicator for the type) and *Vaccinium parvifolium*. The herb layer is dominated by *Polystichum munitum*, usually growing taller and more densely than it does in other settings. Frequent herbs which are indicative of the association are *Athyrium filix-femina*, *Tiarella trifoliata*, *Blechnum spicant*, *Gymnocarpium dryopteris* and *Dryopteris expansa* (=austriaca), one or more of which is sometimes prominent. Other frequent herbs include *Achyls triphylla* and *Clintonia uniflora*.

<u>Comments</u>: This association is distinguished by the relative abundance of the wet to moist-site indicator herbs, the presence of *Rubus spectabilis*, or the high percent cover of *Polystichum munitum*.

Conservation Rank: S3

Rank Justification: This association occurs within a narrow environmental range in the mountains of western Washington and has been impacted by logging.

Populus balsamifera ssp. trichocarpa/Alnus incana Forest

Black Cottonwood/Mountain Alder Forest

<u>Acronym</u>: POPBAL/ALNINC <u>NatureServe Code</u>: CEGL000667

<u>Macrogroup</u>: Vancouverian Flooded & Swamp Forest **Group**: North Pacific Lowland Riparian Forest and Woodland

Alliance: Populus balsamifera ssp. trichocarpa - (Acer, Alnus) Riparian Forest

Alliance

Classification Confidence Level: 2

Range: This association occurs in the east Cascades and Northern Rockies.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This riparian forest association appears where valley gradient tends to be gentle in low to mid-elevation, relatively broad valleys usually with meandering streams. This type is located on stream banks, lower stream terraces and wetter surfaces in the floodplain. Soils are sandy to loamy often over gravels.

Photo Not Available

<u>Vegetation Description</u>: The canopy is usually dominated by *Populus balsamifera* ssp. *trichocarpa. Alnus incana* dominates a diverse and well-developed tall-shrub layer. A shorter shrub layer often appears with *Symphoricarpos albus* providing the most cover. *Equisetum arvense* and *Elymus glaucus* are frequent associates in the herb layer.

USFWS Wetland System: Palustrine.

<u>Comments</u>: This is an east Cascades type in the literature and is not represented in the current dataset of vegetation plot data for national parks in Washington. North Cascades Park may have riparian forest similar to this association.

Conservation Rank: S3

<u>Rank Justification</u>: This association is susceptible to grazing, and many stands have been converted to understories dominated by introduced grasses. Dams and diversions have altered annual flooding and scouring events, thereby decreasing depositional floodplain features required for the establishment of *Populus balsamifera* ssp. *trichocarpa*.

Synonyms:

Populus balsamifera ssp. trichocarpa/Alnus incana Forest; Chappell 2005 NPK

Populus balsamifera ssp. trichocarpa/Cornus sericea Forest

Black Cottonwood/Red-osier Dogwood Forest

<u>Acronym</u>: POPBAL/CORSER NatureServe Code: CEGL000672

<u>Macrogroup</u>: Vancouverian Flooded & Swamp Forest

Group: North Pacific Lowland Riparian Forest and Woodland

Alliance: Populus balsamifera ssp. trichocarpa – (Acer, Alnus) Riparian Forest

Alliance

Classification Confidence Level: 2

Range: This association occurs in the east Cascades and Northern Rockies.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This association occurs on stream terraces at low to mid -elevations in relatively broad valleys usually with meandering streams. Soils are deep loams often over gravels.

Vegetation Description: The canopy is dominated by Populus balsamifera ssp.

trichocarpa. Cornus sericea (=stolonifera) dominates a well developed tall-shrub layer. Maianthemum (=Smilacina) stellatum and Elymus glaucus are frequent associates in the ground cover.

USFWS Wetland System: Palustrine.

<u>Comments</u>: Lower terraces and overflow channels are co-dominated by *Alnus incana* and represent a transition to the wetter *Populus balsamifera* ssp. *trichocarpal Alnus incana* association (CEGL000667). This is an east Cascades type in literature and is not represented in the current data for national parks in Washington. North Cascades Park may have riparian forest similar to this association.

Conservation Rank: S2S3

Rank Justification: Dams and diversions have altered annual flooding and scouring events, thereby decreasing depositional floodplain features required for the establishment of *Populus balsamifera* ssp. *trichocarpa*.

<u>Synonyms</u>

NatureServe Code: Provisional

<u>Macrogroup</u>: Vancouverian Flooded & Swamp Forest **Group**: North Pacific Lowland Riparian Forest and

Woodland

<u>Alliance</u>: Populus balsamifera ssp. trichocarpa – (Pseudotsuga, Picea, Tsuga) Riparian Forest Allliance

Classification Confidence Level: 3

Range: This association occurs primarily on the Olympic Peninsula and in the Puget Lowlands.

Plots: 2, MORA (0), NOCA (0), OLYM (2), Other (0)

Environmental Description: This low elevation forested wetland association occurs on floodplains and terraces. Soils are rich, wet and have strongly fluctuating water table.

Vegetation Description: Populus balsamifera ssp.

trichocarpa and Alnus rubra dominate or co-dominate this broadleaf forest association. Thuja plicata is occasionally prominent and Picea sitchensis is common but has low cover. Carex obnupta is dominant to prominent. Symphoricarpos albus is often prominent. Other herbs include Elymus glaucus (which may be co-dominant), Carex deweyana, Stachys chamissonis var. cooleyae, and Polystichum munitum.

USFWS Wetland System: Palustrine.

<u>Comments</u>: This association is similar to the depressional wetland *Populus balsamifera* spp. *trichocarpa/Cornus* sericea/Carex obnupta (PNWCOAST_113). Inclusion of these western Olympic plots within that Georgia Basin/Puget Lowland type would expand its concept to include riverine associated wetlands, a much wetter climate, and differing associated species. *Cornus sericea* (=stolonifera) and *Oemleria cerasiformis* are common in the Puget Lowland/British Columbia type.

Conservation Rank: S2Q

Rank Justification: Insufficient information exists to rank this provisional association.

Populus balsamifera ssp. trichocarpa-Picea sitchensis-(Acer macrophyllum)/Oxalis oregana Forest

Black Cottonwood-Sitka Spruce-(Bigleaf Maple)/Redwood Sorrel Forest

Acronym: POPBAL-PICSIT-(ACEMAC)/OXAORE

NatureServe Code: CEGL003418

<u>Macrogroup</u>: Vancouverian Flooded & Swamp Forest

Group: North Pacific Lowland Riparian Forest and

Woodland

<u>Alliance</u>: Populus balsamifera ssp. trichocarpa – (Pseudotsuga, Picea, Tsuga) Riparian Forest Alliance

Classification Confidence Level: 2

Range: This association occurs on the western Olympic

Peninsula.

Plots: 6, MORA (0), NOCA (0), OLYM (6), Other (0)

<u>Environmental Description</u>: This association occurs at low elevations along major rivers on middle to high fluvial terraces, typically where seasonal flooding is infrequent.

Vegetation Description: The mixed-forest canopy is

typically co-dominated by Populus balsamifera ssp. trichocarpa, Picea sitchensis and often Acer macrophyllum or Alnus rubra. Populus balsamifera ssp. trichocarpa is usually the tallest tree and may emerge above the main canopy. Picea sitchensis and/or Acer macrophyllum typically dominate a mid or subcanopy layer. The understory is variably dense but often includes substantial Rubus spectabilis or Acer circinatum. Polystichum munitum and Oxalis oregana are present and often co-dominant in the herb layer. Stands with Tsuga heterophylla present may represent later development stages of this association. Poa trivialis may be common in stands indicating heavy ungulate use.

USFWS Wetland System: Not applicable.

<u>Comments</u>: These appear to be mid-seral stands that without a flooding/depositional event slowly increase in conifer dominance.

Conservation Rank: S2

Rank Justification: There are few occurrences of this association and it covers a limited areal extent. It appears to be limited to a small geographic range, the western Olympic Peninsula, where it is highly dependent on riverine flooding and channel migration and, possibly, on freedom from excessive ungulate browsing. Most occurrences do not appear to be viable in the long term and are probably declining in extent because of lack of regeneration of cottonwood stands (the latter is hypothesized to be related to heavy elk browsing in the area). Exotic species are present in most stands to varying degrees and are probably spreading over time.

<u>Alliance</u>: Populus balsamifera ssp. trichocarpa – (Pseudotsuga, Picea, Tsuga) Riparian Forest Alliance

Classification Confidence Level: 3

Range: The sample defining the type is located in the North

Cascades.

Plots: 1, MORA (0), NOCA (1), OLYM (0), Other (0)

<u>Environmental Description</u>: The plot representing this riparian type was located on a floodplain at 380 m (1252 ft)

elevation.

Vegetation Description: A mixture of conifers,

Pseudotsuga menziesii and Pinus ponderosa, and deciduous trees, Populus balsamifera and Acer macrophyllum, form the tree canopy. A tall shrub layer is dominated by Acer circinatum. Cornus nuttallii, Mahonia aquifolium, and Symphoricarpos albus can also be prominent in a well-devoped shrub layer. A forb layer is not well developed.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This provisional type shares some similarities to the provisional *Pseudotsuga menziesii-(Pinus ponderosa)/Symphoricarpos albus* floodplain type but differs significantly due to the dominance of *Acer circinatum*.

Conservation Rank: SQ

Rank Justification: There is insufficient information to rank this association.

Acer circinatum Shrubland

Vine Maple Shrubland

Acronym: ACECIR

NatureServe Code: Preliminary

<u>Macrogroup</u>: Vancouverian Flooded & Swamp Forest **Group**: North Pacific Lowland - Montane Riparian and Wet

Slope Shrubland

<u>Alliance</u>: Acer circinatum Shrubland <u>Classification Confidence Level:</u> 2

Range: This association occurs in the Cascades and

Olympic Mountains.

Plots: 14, MORA (7), NOCA (6), OLYM (1), Other (0)

Environmental Description: This association occurs at low to middle elevations 350-1100 m (1200-3600 ft). Sites include dry talus, rock slides or relatively dry streambanks on small streams. Fire scars or charcoal can be associated with stands that resulted from extensive high-severity fires and that persisted due to repeated fire or other tree-removing disturbances.

<u>Vegetation Description</u>: A well-developed tall shrub layer is dominated by *Acer circinatum*. However, many other shrub species can occur. *Rubus spectabilis* or *Oplopanax horridus* occur only in trace amounts or are absent. Other shrubs such as *Paxistima* (=*Pachistima*) *myrsinites*, *Corylus cornuta* and *Rubus parviflorus* can be prominent. The herbaceous layer is typically sparse and lacks moist-site species (e.g. *Athyrium filix-femina*) except in very small amounts. When *Polystichum munitum* is present its cover is usually low. *Pteridium aquilinum* can be abundant. *Trillium ovatum* and *Galium triflorum* are the most common understory species.

USFWS Wetland System: Not applicable

<u>Comments</u>: This is similar to the *Acer circinatum-Pachistima myrsinites* seral vegetation described in the northern Oregon Cascades (White et al. 1996).

Conservation Rank: S4

Rank Justification: This association occurs within a wide geographic range with few threats.

Alnus viridis ssp. sinuata Shrubland

Sitka Alder Shrubland

Acronym: ALNVIR

NatureServe Code: CEGL001154

<u>Macrogroup</u>: Vancouverian Flooded & Swamp Forest

Group: North Pacific Lowland - Montane Riparian and Wet

Slope Shrubland

Alliance: Alnus viridis ssp. sinuata Shrubland

Classification Confidence Level: 3

Range: This association occurs in the Cascade and Olympic

Mountains.

Plots: 8, MORA (0), NOCA (4), OLYM (4), Other (0)

<u>Environmental Description</u>: This association occurs at middle to high elevations on a variety of sites that are often steep. Such areas occurs above glacier meadows, near large lateral moraines, near small dry subalpine streambeds, on talus and on debris cones. Site are topographically moist but well-drained.

<u>Vegetation Description</u>: The well-developed tall shrub layer is dominated by *Alnus viridis* ssp. *sinuata*. Few other shrubs are present with the exception of Sambucus racemosa. The associated understory species are diverse although no single species appears in all plots. *Heracleum maximum* (=lanatum), *Hydrophyllum fendleri* and *Thalictrum occidentale* are the most constant and are often prominent. *Claytonia* (=Montia) sibirica, Maianthemum (=Smilacina) stellatum, Valeriana sitchensis, Veratrum viride, and *Pteridium aquilinum* are infrequent but are prominent to co-dominant when they do occur.

USFWS Wetland System: Not applicable.

<u>Comments</u>: More plots or a broader regional analysis may be needed to better describe and distinguish this assocation from related types. This is association is very similar to the *Alnus viridis* ssp. *sinuata* / Mesic Forbs Shrubland association (CEGL002633). An additional Olympic plot, which appears in the table as SORSIT-ALNVIR, could be included here.

Conservation Rank: S4S5

Rank Justification: This association is relatively widespread and has few threats.

Red-Osier Dogwood Shrubland

Acronym: CORSER

NatureServe Code: CEGL001165

Macrogroup: Vancouverian Flooded & Swamp Forest

Group: North Pacific Lowland - Montane Riparian and Wet Slope Shrubland

<u>Alliance</u>: Cornus sericea Shrubland <u>Classification Confidence Level</u>: 3

Range: This type is based on a single plot in the North Cascades. It may occur infrequently in riparian areas of this or other parks, as it is a widespread though rather uncommon, riparian community in western Washington.

Plots: 1, MORA (0), NOCA (1), OLYM (0), Other (0)

Environmental Description: This association occurs in riparian floodplains and wetlands. This NOCA plot appears on shallow sloping, stabilized talus at 700 m (2292 ft) elevation. Duff and litter cover the rocky soil surface on a moist topographic position.

<u>Vegetation Description</u>: Cornus sericea (=stolonifera) dominates, but otherwise the global type is variable in composition,. The sampled vegetation is a thick shrubland dominated by Cornus sericea (=stolonifera) and Salix scouleriana. Rubus parviflorus and Hydrophyllum fendleri form a dense ground cover.

USFWS Wetland System: Palustrine.

Comments: This is considered to be a provisional association that encompasses all Cornus sericea-dominated shrublands.

Conservation Rank: S3S4Q

Rank Justification: This provisional association occurs throughout Washington in somewhat localized sites. Direct or indirect alteration of hydrology resulting from road construction, timber harvest, and other land uses are threats.

Salix sitchensis/Equisetum arvense-Petasites frigidus Shrubland

Sitka Willow/Common Horsetail-Sweet Coltsfoot Shrubland

<u>Acronym</u>: SALSIT/EQUARV-PETFRI <u>NatureServe Code</u>: CEGL003296

Macrogroup: Vancouverian Flooded & Swamp Forest

Group: North Pacific Lowland - Montane Riparian and Wet

Slope Shrubland

Alliance: Salix sitchensis Riparian Shrubland

Classification Confidence Level: 2

Range: This association occurs in western Washington.

Plots: 1, MORA (1), NOCA (0), OLYM (0), Other (0)

Environmental Description: This riparian association occurs at low to montane elevations on floodplains or low terraces. These sites are probably frequently flooded by overbank riverine flooding, and have coarse-textured soils (gravelly and/or sandy). It is most often found along larger streams or rivers with well-developed floodplains.

layer is dominated by *Salix sitchensis*. Young *Alnus rubra* can be present to co-dominant or *Populus balsamifera* ssp. *trichocarpa* is often present. Small amounts of *Rubus spectabilis* are usually present. The herbaceous layer varies from rather sparse to moderately dense. *Equisetum arvense* or *Petasites frigidus* are usually present. A variety of other herbs may be present.

<u>Comments</u>: This type is common along the Elwha River in OLYM often with *Alnus rubra* as a co-dominant in the tall shrub layer. The MORA plot is at a higher elevation than the previous concept and has numerous subalpine species prominent (*Valeriana sitchensis*, *Arnica latifolia*). Riparian and wetland environments are undersampled for this project.

Conservation Rank: S4Q

Rank Justification: This provisional type occurs within a narrow environment that has few known threats in Washington.

<u>Macrogroup</u>: Vancouverian Flooded & Swamp Forest <u>Group</u>: North Pacific Lowland - Montane Riparian and Wet

Slope Shrubland

Alliance: Symphoricarpos albus Shrubland

Classification Confidence Level: 3

Range: This association is described from the Olympic

Mountains.

Plots: 2, MORA (0), NOCA (0), OLYM (2), Other (0)

<u>Environmental Description</u>: This association occurs in avalanche chutes at mid-elevations on gentle to moderate slopes. It appears both within the track and at the debris apron at the base of chutes.

<u>Vegetation Description</u>: This dense shrubland is dominated by *Symphoricarpos albus*. Other common shrubs

include Malus (=Pyrus) fusca, Alnus viridis ssp. sinuata, Holodiscus discolor, Prunus emarginata and Amelanchier alnifolia. Pseudotsuga menziesii and Abies lasiocarpa dominate the surrounding forests.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S2S4Q

Rank Justification: This tentative association occurs within a narrow environmental range on sites that have few threats.

Abies amabilis/Rubus spectabilis-Vaccinium alaskaense Forest

Pacific Silver Fir/Salmonberry-Alaska Blueberry Forest

Acronym: ABIAMA/RUBSPE-VACALA

NatureServe Code: Provisional

<u>Macrogroup</u>: Vancouverian Flooded & Swamp Forest <u>Group</u>: North Pacific Montane Riparian Woodland

Alliance: Abies amabilis-Tsuga heterophylla-(Pseudotsuga

menziesii) Riparian Forest

Classification Confidence Level: 3

Range: This is identified solely from data from Olympic National Park.

Plots: 1, MORA (0), NOCA (0), OLYM (1), Other (0)

Environmental Description: The single plot representing this type is located on a 5% slope on an old river terrace at 465 m (1520 ft) elevation.

<u>Vegetation Description</u>: An open canopy (60% cover) is dominated by *Tsuga heterophylla* and *Abies amabilis*. Tree regeneration is mainly *Tsuga heterophylla*. A dense shrub

layer is dominated by *Rubus spectabilis*, with *Vaccinium alaskaense* and *Rubus parviflorus* present in small amounts. The herb layer is well developed with many species, most abundantly *Tolmiea menziesii*, *Viola glabella*, *Polystichum munitum*, *Tiarella trifoliata* and *Gymnocarpium dryopteris*.

USFWS Wetland System: Palustrine

<u>Comments</u>: More sampling is needed to determine if this valley bottom vegetation represents a new association or variation within existing riparian or other wet site types. This provisional *Abies amabilis* association is related to the *Pseudotsuga menziesii-(Alnus rubra-Tsuga heterophylla)/Rubus spectabilis* Forest (PNWCOAST_158).

Conservation Rank: S2S4Q

Rank Justification: Insufficient information exists to rank or adequately classify this tentative association

Abies amabilis-Tsuga heterophylla/Oplopanax horridus Forest

Pacific Silver Fir-Western Hemlock/Devil's-club Forest

Acronym: ABIAMA-TSUHET/OPLHOR NatureServe Code: CEGL000004

<u>Macrogroup</u>: Vancouverian Flooded & Swamp Forest <u>Group</u>: North Pacific Montane Riparian Woodland

Alliance: Abies amabilis-Tsuga heterophylla-(Pseudotsuga

menziesii) Riparian Forest

Classification Confidence Level: 2

Range: This association occurs in the Cascades and the

Olympic Mountains.

<u>Plots</u>: 34, MORA (26), NOCA (5), OLYM (2), Other (1) <u>Environmental Description</u>: This association occurs at middle elevations on sites with shallowly subirrigated soils that are poorly drained, usually due to an underlying impermeable layer. Sites are often associated with springs, seeps or small streams.

Vegetation Description: The canopy is usually co-

dominated by *Abies amabilis* and *Tsuga heterophylla*, with *Thuja plicata* often co-dominant as well. *Abies amabilis* usually dominates tree regeneration and always has at least 10% total cover. *Pseudotsuga menziesii* is occasionally prominent to codominant. The shrub layer always has at least 5% cover of *Oplopanax horridus*, which typically dominates or co-dominates the undergrowth. A variety of other shrubs may be prominent to co-dominant, especially *Vaccinium alaskaense* and *Rubus spectabilis*. A rich herb layer is rather variable in composition but almost always has considerable *Tiarella trifoliata* var. *unifoliata*, *Gymnocarpium dryopteris* and/or *Athyrium filix-femina*. Other frequent herbs are *Viola glabella*, *Clintonia uniflora*, *Trillium ovatum*, and *Streptopus lanceolatus* (=roseus) var. curvipes.

USFWS Wetland System: Palustrine.

<u>Comments</u>: One plot at North Cascades may be included in this association. In that plot, the canopy is co-dominated by *Abies amabilis* and *Populus balsamifera* spp. *trichocarpa*, with a rather sparse understory (28% total cover) with *Oplopanax horridus* most abundant at 3%. It is listed in the stand table as ABIAMA-POPBAL/OPLHOR.

Conservation Rank: S5

Rank Justification: Many natural-origin stands occur on protected lands with few threats from logging and development.

Forest and Woodland

Classification Confidence Level: 3

Range: This is described from the northeast Olympic Mountains.

<u>Plots</u>: 1, MORA (0), NOCA (0), OLYM (1), Other (0) <u>Environmental Description</u>: This stand is located on a riparian terrace (1% slope) at 1020 m (3340 ft) elevation.

<u>Vegetation Description</u>: An open, tall- tree canopy (50%) is dominated by *Abies lasiocarpa* with some *Picea* engelmannii. A dense shrub layer is dominated by *Rubus* spectabilis, with *Lonicera involucrata* and *Ribes lacustre*.

USFWS Wetland System: Palustrine.

<u>Comments</u>: This plot represents the only stand in OLYM with *Picea engelmannii*. More data is needed to verify the status of this association.

Conservation Rank: S2S4Q

Rank Justification: Insufficient information exists to rank or adequately classify this provisional association.

Bromus sitchensis-Carex phaeocephala Herbaceous Vegetation

Alaska Brome-Dunhead Sedge Herbaceous Vegetation

<u>Acronym</u>: BROSIT-CARPHA <u>NatureServe Code</u>: Provisional

Macrogroup: Northern Rocky Mountain-Vancouverian Mesic Grassland & Forb

Meadows

Group: Northern Rocky Mountain-Vancouverian Subalpine-Montane Dry

Herbaceous Meadow

Alliance: Bromus sitchensis-Carex phaeocephala Meadow

Classification Confidence Level: 3

Range: This type occurs in the Olympic Mountains and is possible in the

Cascades.

Plots: 2, MORA (0), NOCA (0), OLYM (2), Other (0)

Environmental Description: This association occurs in dry avalanche chutes and debris slides between 1450 and 1700 m (4800-5500 ft) elevation. Gradient is steep

(55 and 70%) on south to southwest aspects. The soil surface is typically covered with litter or mineral soil, with little to no rock exposed.

<u>Vegetation Description</u>: Bromus sitchensis dominates the dense vegetation with other graminoids, such as, Carex phaeocephala, Carex spectabilis, Carex rossii and Trisetum spicatum present in lesser amounts. Associated forbs include Phacelia hastata, Lupinus (arcticus ssp. subalpinus, latifolius), Polygonum bistortoides, and Cirsium edule.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S2S4

Rank Justification: The provisional association occurs within a limited geographic range and environment. Known sites are in

protected areas.

Synonyms:

Acronym: HYDFEN

NatureServe Code: Provisional

Macrogroup: Northern Rocky Mountain-Vancouverian Mesic Grassland & Forb

Meadows

Group: Northern Rocky Mountain-Vancouverian Subalpine-Montane Dry

Herbaceous Meadow

Alliance: Hydrophyllum fendleri Herbaceous Vegetation

Classification Confidence Level: 3

Range: This association is described from the Olympic Mountains although it is

also likely found in the Cascades.

Plots: 8, MORA (0), NOCA (0), OLYM (8), Other (0)

Environmental Description: This association occurs between 1640-1920m

(5400-6300 ft) elevation on moderately steep, southerly aspects.

<u>Vegetation Description</u>: The vegetation is dominated by *Hydrophyllum fendleri*, often co-dominated by *Thalictrum occidentale*. *Abies lasiocarpa* is present with <5% cover. Most plots include *Bromus sitchensis*, *Achillea millifolium*, *Epilobium anagallidifolium*, *Phacelia hastata*, *Packera flettii*, *Erysimum arenicola* and *Cirsium edule*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: More environmental information is needed to better distinguish this provisional association. Schreiner (1994) included this type with the broadly defined *Phacelia hastata* community located on dry colluvial fans.

Conservation Rank: S3S5Q

Rank Justification: This provisional association occurs within a narrow range of environments with few threats on protected land.

Artemisia ludoviciana-Lomatium martindalei Herbaceous Vegetation

<u>Acronym</u>: ARTLUD-LOMMAR <u>NatureServe Code</u>: Preliminary

<u>Macrogroup</u>: Northern Rocky Mountain-Vancouverian Mesic Grassland &

Forb Meadows

Group: Northern Rocky Mountain-Vancouverian Subalpine-Montane Dry

Herbaceous Meadow

Alliance: Phacelia hastata Herbaceous Vegetation

Classification Confidence Level: 2

Range: This association occurs in the Olympic and Cascade Mountains.

Plots: 15, MORA (0), NOCA (1), OLYM (14), Other (0)

Environmental Description: This association occurs between 1580 and 2010 m (5200 and 6600 ft) elevation on 25-70% slopes on scree, talus or other rocky sites. Aspects are generally southerly.

<u>Vegetation Description</u>: Artemisia ludoviciana is the most abundant plant (25% average cover) in a sparse to nearly closed vegetation. Lomatium martindalei and Phacelia hastata occur in most sites. Delphinium glareosum, Erysimum arenicola, Epilobium anagallidifolium, Achillea millefolium, Poa secunda (=sandbergii), and Phlox diffusa are frequent associates, typically with low cover.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S4

Rank Justification: This preliminary association occurs within a restricted ecological range with few threats.

Eucephalus paucicapitatus Herbaceous Vegetation

Olympic Mountain Aster Herbaceous Vegetation

Group: Northern Rocky Mountain-Vancouverian Subalpine-

Montane Dry Herbaceous Meadow

Alliance: Phacelia hastata Herbaceous Vegetation

Classification Confidence Level: 2

Range: This association occurs only in the Olympic

Mountains.

Plots: 13, MORA (0), NOCA (0), OLYM (13), Other (0)

Environmental Description: This association appears on open slopes at subalpine to low alpine elevations (5000-6400 ft) on moderately steep, south to easterly aspects. Sites can be on colluvial fans. Soils are often rocky.

Vegetation Description: This open to sparse vegetation is

dominated by Eucephalus (=Aster) paucicapitatus with a few constant associates such as Epilobium anagallidifolium, Lomatium martindalei, Polygonum bistortoides, Phlox diffusa, and Phacelia hastata. Other subalpine meadow species, including Carex spectabilis, Lupinus (arcticus ssp. subalpinus, latifolius), Valeriana sitchensis are frequently present but rarely more than prominent.

USFWS Wetland System: Not applicable.

Comments: This community is included in the broadly defined Phacelia hastata vegetation of Schreiner (1994).

Conservation Rank: S2

<u>Rank Justification</u>: This association is endemic to the Olympic Mountains and Vancouver Island and occurs within a restricted ecological range on protected land with few threats.

NatureServe Code: Preliminary

Macrogroup: Northern Rocky Mountain-Vancouverian Mesic Grassland & Forb

Meadows

Group: Northern Rocky Mountain-Vancouverian Subalpine-Montane Dry

Herbaceous Meadow

Alliance: Phacelia hastata Herbaceous Vegetation

Classification Confidence Level: 3

Range: This association occurs in the Olympic Mountains, Mount Rainier National

Park and on other Cascadian volcanoes.

Plots: 4, MORA (2), NOCA (0), OLYM (2), Other (0)

Environmental Description: This association occurs at subalpine to alpine elevations. Sites occupy moderately steep, rocky, often pumice soils. Exposed mineral soil is common on unstable soils.

<u>Vegetation Description</u>: Vascular plant cover ranges from sparse to open in this type. *Polygonum davisiae* (=newberryii) is dominant or most abundant. Many other species such as, *Penstemon davidsonii*, *Lupinus (arcticus* ssp. *subalpinus*, *latifolius)*, *Eucephalus (=Aster) paucicapitatus* and *Achillea millefolium* can be found, but always occur with low cover.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is currently recognized as a dominance type. More plots are needed to clarify this preliminary

type.

Conservation Rank: S2S3

Rank Justification: This preliminary association occurs within a narrow environmental range although with few threats.

Synonyms:

Polygonum newberryi Associes; Hamann 1972

Antennaria lanata Herbaceous Vegetation

Woolly Pussytoes Herbaceous Vegetation

Acronym: ANTLAN

NatureServe Code: CEGL001949

Macrogroup: Northern Rocky Mountain-Vancouverian Mesic Grassland & Forb

Meadows

Group: Northern Rocky Mountain-Vancouverian Subalpine-Montane Mesic Herbaceous

Meadow

Alliance: Antennaria lanata -(Juncus parry) Meadow

Classification Confidence Level: 2

Range: This association occurs in the Cascade and Olympic Mountains.

Plots: 8, MORA (2), NOCA (0), OLYM (6), Other (0)

<u>Environmental Description</u>: This association occurs in subalpine meadows or in the alpine zone. Sites are usually gentle slopes or flats that have relatively late snow-melt and receive above average moisture. Soils are well-drained and often rocky.

<u>Vegetation Description</u>: The forb *Antennaria lanata* dominates this short, often open vegetation, usually with more cover than all other species. Dwarf-shrubs, e.g. *Salix cascadensis* or *Phyllodoce empetriformis*, can be present but subordinate in importance. *Carex nigricans, Carex spectabilis, Polygonum bistortoides, Oreostemma (Aster) alpigenum, Hieracium gracile* or *Juncus parryi* are often present. Although floristic diversity tends to be low, moss/lichen cover can be high.

USFWS Wetland System: Not applicable.

<u>Comments</u>: The *Juncus drummondii-Antennaria lanata* association (CEGL001904) in Montana appears in similar habitats as this association but is co-dominated by *Juncus* and other graminoid species.

Conservation Rank: S3S4

<u>Rank Justification</u>: This association occurs within a limited environmental range in Washington but currently has few threats. Climate change will likely affect this association.

Synonyms:

Antennaria lanata Association; Hamann 1972

Montane Mesic Herbaceous Meadow

Alliance: Antennaria lanata -(Juncus parry) Meadow

Classification Confidence Level: 2

Range: This association occurs in the Olympic and Cascade

Mountains.

Plots: 14, MORA (0), NOCA (4), OLYM (10), Other (0)

Environmental Description: This association occurs in subalpine parklands and on open ridges. Sites can be rocky

on steep to gentle slopes.

<u>Vegetation Description</u>: The patchy to closed vegetation is dominated by *Juncus parryi. Antennaria lanata, Arenaria*

capillaris, Lupinus (arcticus ssp. subalpinus, latifolius), Polygonum bistortoides, and Carex spectabilis are frequently present to occasionally prominent, but are never more abundant than *Juncus parryi*. Tree species such as *Cupressus* (=Chamaecyparis) nootkatensis and Abies lasiocarpa occur in transition areas adjacent to tree islands.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is related to other *Juncus parryi* associations (Montana, Colorado, and California) in habitat but differing in floristics.

Conservation Rank: S3S4

Rank Justification: This association occurs within a narrow range of environments with few threats on protected land.

Synonyms:

Range: This association occurs in the Cascade and Olympic

Mountains.

Plots: 64, MORA (1), NOCA (2), OLYM (52), Other (9)

Environmental Description: This subalpine meadow occurs between 1030-2060 m (3400-6750 ft) elevation on well-drained, somewhat moist soils. It occasionally appears in avalanche chutes where trees and other woody species are periodically removed.

<u>Vegetation Description</u>: The vegetation is usually a lush meadow dominated or co-dominated by *Carex spectabilis*. *Polygonum bistortoides* and *Lupinus* (*arcticus* ssp. *subalpinus*, *latifolius*) are usually present to prominent. *Erigeron peregrinus*, *Luetkea pectinata*, and *Valeriana sitchensis* are often present but always less abundant than *Carex spectabilis*. Many other species can occur, but are rarely more than prominent.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This is an expanded concept which now includes the part of the *Lupinus arcticus* ssp. *subalpinus - Polygonum bistortoides - (Carex spectabilis)* association (CEGL001973) that had a high cover of *Carex spectabilis*.

Conservation Rank: S3S4

Rank Justification: This association occurs within a limited geographic range and environment. Known sites are in protected areas.

Synonyms:

Carex spectabilis Community; Douglas 1972

Heracleum maximum Herbaceous Vegetation

Cow Parsnip Herbaceous Vegetation

Acronym: HERMAX

NatureServe Code: CEGL005857

Macrogroup: Northern Rocky Mountain-Vancouverian

Mesic Grassland & Forb Meadows

Group: Northern Rocky Mountain-Vancouverian Subalpine-

Montane Dry Herbaceous Meadow

Alliance: Cascadian Mesic Tall Forb Meadow

Classification Confidence Level: 3

Range: This association occurs in the Olympic and Cascade

Mountains.

Plots: 7, MORA (0), NOCA (0), OLYM (6), Other (1)

Environmental Description: This diverse, forb-dominated meadow association appears in a variety of environments including avalanche tracks and meadows with evidence of fire or other disturbance. Site are rocky or with rocky soil. It appears at mid to high elevation on moderately steep to

steep, often southerly slopes. Patches of Alnus viridis ssp. sinuata may dominate nearby sites.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This is similar to and preliminarily clustered with the *Heracleum maximum* Herbaceous association (CEGL005857) in the Northern Rockies. This association has also been observed by one of the authors in a moist, relatively flat meadow within a larger riparian system at lower elevation in the northeast Olympics. The lack of cover of *Saussurea americana* is the major difference between this type and the *Saussurea americana* - *Heracleum maximum* Herbaceous association (CEGL001945).

Conservation Rank: S3S5

Rank Justification: This preliminary association occurs within a narrow range of environments with few threats on protected land.

Lupinus (arcticus ssp. subalpinus, latifolius) Herbaceous Vegetation

Subalpine Lupine Herbaceous Vegetation

Acronym: LUPARC

NatureServe Code: Preliminary

Macrogroup: Northern Rocky Mountain-Vancouverian

Mesic Grassland & Forb Meadows

Group: Northern Rocky Mountain-Vancouverian Subalpine-

Montane Mesic Herbaceous Meadow

Alliance: Cascadian Mesic Tall Forb Meadow

Classification Confidence Level: 3

Range: This association occurs in the Cascade and

Olympic Mountains.

<u>Plots</u>: 47, MORA (1), NOCA (0), OLYM (46), Other (0) <u>Environmental Description</u>: This subalpine meadow occurs on gentle to steep slopes with well-drained and at least slightly moist soils. Aspects are typically southerly although it occurs on all aspects. Soils can be rocky especially on more sparsely vegetated sites.

<u>Vegetation Description</u>: The variable canopy is consistently dominated by *Lupinus (arcticus* ssp. *subalpinus, latifolius.)*. Many other species typically occur but have low cover. *Phlox diffusa* is the most frequently abundant associated species and sometimes is co-dominant with *Lupinus (arcticus* ssp. *subalpinus, latifolius)*. *Carex spectabilis, Polygonum bistortoides, Juncus parryi* are often present to prominent but with less cover than *Lupinus*. *Lomatium martindalei, Trisetum spicatum* and *Hieracium gracile* are frequently present with low cover.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association more narrowly defines the concept of the *Lupinus arcticus* ssp. *subalpinus - Polygonum bistortoides - (Carex spectabilis*) (CEGL001973) association. As defined here, samples with *Carex spectabilis* dominance/codominance are merged into *Carex spectabilis-(Lupinus arcticus* ssp. *subalpinus-Polygonum bistortoides)* Herbaceous Vegetation (CEGL001828). The former association may appear as sparse or lithomorphic vegetation on steep, more rocky sites where *Lupinus (arcticus ssp. subalpinus, latifolius)* is the most abundant vascular plant (LUPARC lithomorphic in table).

Conservation Rank: S3

<u>Rank Justification</u>: This association is geographically restricted and is represented on many protected areas that have few threats. Climate change will likely affect this vegetation.

Montane Mesic Herbaceous Meadow Alliance: Festuca viridula Meadow Classification Confidence Level: 2

Range: This association occurs in northern and eastern Mount Rainier National Park and in the North Cascades.

Plots: 19, MORA (10), NOCA (1), OLYM (0), Other (8)

Environmental Description: This dry subalpine meadow association occurs on moderate to steep, southerly slopes with well-drained soils. Bare ground is a common feature of this vegetation.

Vegetation Description: The vegetation is dominated or

co-dominated by Festuca viridula. Eucephalus (=Aster) ledophyllus is always present to sometimes co-dominant. Lupinus (arcticus ssp. subalpinus, latifolius) or Ligusticum grayi is often prominent to co-dominant. Arnica parryi, Nothocalais (=Microseris) alpestris, and Penstemon confertus are somewhat frequent in higher elevation sites. Xerophyllum tenax is present to prominent in burned sites.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association and the *Festuca viridula- Lupinus (arcticus, latifolius)* association (CEGL001635) are similar with latter being a more mesic, often occurring at lower elevations, and primarily distinguished by the absence or low abundance of *Eucephalus ledophyllus*. One North Cascades plot included here is dominated by *Eucephalus ledophyllus* and *Carex spectabilis* with only a presence of *Festuca viridula* and 5-10% cover of *Vaccinium deliciosum*. It appears to be transitional to the type described here or the preliminary *Vaccinium deliciosum/Festuca viridula* association.

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs within a restricted range of environments with few threats on protected land. Climate change will likely affect this vegetation.

Range: This association occurs in northern and eastern Mount Rainier and

in the eastern North Cascades.

Plots: 27, MORA (11), NOCA (4), OLYM (0), Other (12)

<u>Environmental Description</u>: This mesic to dry subalpine meadow and lower alpine association occurs on well-drained soils and southerly facing slopes.

<u>Vegetation Description</u>: The vegetation is dominated or co-dominated by Festuca viridula. Lupinus (arcticus ssp. subalpinus, latifolius) is usually present to co-dominant. Carex spectabilis, Luetkea pectinata, and Polygonum bistortoides are often present to prominent. Other common species include Potentilla flabellifolia, Antennaria lanata, Hieracium gracile, Juncus parryi, Ligusticum grayi, and Oreostemma alpigenum.

<u>Comments</u>: This association and the *Festuca viridula-Eucephalus ledophyllus* association are similar with latter being a drier meadow that is often higher and distinguished by prominence to co-dominance of *Eucephalus ledophyllus*.

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs within a restricted range of environments with few threats on protected land. Climate change will likely affect this vegetation.

NatureServe Code: CEGL001918

Macrogroup: Northern Rocky Mountain-Vancouverian Mesic Grassland & Forb

Meadows

Group: Northern Rocky Mountain-Vancouverian Subalpine-Montane Mesic

Herbaceous Meadow

Alliance: Luetkea pectinata Herbaceous Vegetation

Classification Confidence Level: 2

Range: This association occurs in the Cascade and the Olympic Mountains.

Plots: 71, MORA (0), NOCA (0), OLYM (60), Other (11)

Environmental Description: This association occurs in the subalpine parkland. Sites range from north- to west-facing moderate to steep slopes with well-drained soils to gentle slopes and flats with somewhat poorly soils. Rocks 11-70 cm (4.3-27.5 in) in size frequently compose the substrate in the Olympics.

Photo Not Available

<u>Vegetation Description</u>: This open to sparse, short vegetation, typically 6 inches (15 cm) tall, is dominated or co-dominated by the semi-shrub *Luetkea pectinata* (average cover 19%). *Luetkea* is always the most abundant species. Many herbaceous species can occur, all typically with low cover. *Luzula piperi, Hieracium gracile, Juncus parryi* and *Carex spectabilis* are most frequent species in Olympics. Schreiner (1994) notes that this vegetation appears to occur on recently colonized sites.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is a name change of the *Luetkea pectinata - Saxifraga tolmiei* Herbaceous Vegetation (CEGL001918).

Conservation Rank: S4

<u>Rank Justification</u>: This association is restricted to high elevations in the more maritime climates of the Pacific Northwest and represented on many protected areas with few threats. Climate change will likely affect this vegetation.

<u>Synonyms</u>:

southerly aspects) with well-drained soils.

Ily

Carex spectabilis and Phlox diffusa. Solidago
Cascade alpine plots. Sites in the Olympics

Photo Not

Available

<u>Vegetation Description</u>: This moderately dense vegetation is dominated by *Carex spectabilis* and *Phlox diffusa*. *Solidago multiradiata* is usually prominent and may occur as a co-dominant in the North Cascade alpine plots. Sites in the Olympics often have *Antennaria microphylla*, *Arenaria capillaris*, *Erysimum arenicola*, *Lomatium martindalei*, *Luzula comosa* (=campestris, congesta), *Poa cusickii* and *Polygonum bistortoides*. *Carex breweri*, *Danthonia intermedia*, *Cerastium arvense*, *Achillea millefolium*, *Polygonum bistortoides*, and *Sibbaldia procumbens* are regular in alpine sites of the Cascades.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association has expanded the concept of *Phlox diffusa* ssp. *longistylis-Carex spectabilis* (CEGL001979) as previously defined to include more subalpine species and environments present in the Olympics.

Conservation Rank: S3S4

<u>Rank Justification</u>: This association occurs within a limited geographic range and environment. Known sites are in protected areas. Climate change will likely affect this vegetation.

Alliance: Phlox diffusa Herbaceous Vegetation

Classification Confidence Level: 2

Range: This association occurs in the Olympic Mountains,

Mount Rainier and elsewhere in the Cascades.

Plots: 55, MORA (3), NOCA (1), OLYM (44), Other (7)

Environmental Description: This association occurs at middle elevations up to the lower alpine. Sites are moderate to steep, southerly slopes, with well-drained, very shallow or really sails.

rocky soils.

Vegetation Description: Vascular plant cover ranges from

sparse to moderate in this type. *Phlox diffusa* is always prominent to co-dominant. *Lomatium martindalei* is usually present to prominent. Other herbaceous species are present although few appear consistently. *Achillea millefolium, Arenaria capillaris, Carex phaeocephala, Erysimum arenicola,* and *Phacelia hastat*a are frequent associates.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Schreiner (1994) states that this may represent an earlier sucessional or steep, wet site version of the preliminary <u>Dasiphora fruticosa</u> lithomorphic association. This association expands the concept of <u>Phlox diffusa-(Lomatium martindalei-Penstemon subserratus</u>) of Chappell (2006) to include subalpine sites. Alpine sites with <u>Phlox diffusa</u> are better recognized as the preliminary <u>Phlox diffusa-Lupinus sellulus</u> var. <u>lobbii-(Pedicularis contorta)</u> association.

Conservation Rank: S3S4

Rank Justification: The association occurs on many sites over a wide elevation range. Lower elevation sites are more subject to exotic species invasion and recreational activities than high elevation sites.

Synonyms:

Alliance: Pseudoroegernia spicata - Danthonia intermeida

Herbaceous Vegetation (Providisional)

Classification Confidence Level: 3

Range: This association occurs in the Cascade Mountains.

Plots: 3, MORA (0), NOCA (3), OLYM (0), Other (0)

Environmental Description: This association occurs at 450 to 560 m (1480-1846 ft) on south-facing, dry sites on gentle to moderately steep sloes. Soils are rocky with little soil development.

Vegetation Description: This open to sparse vegetation is

dominated by *Danthonia intermedia*. Arctostaphylos uva-ursi, Achillea millifolium, Carex concinnoides and Zigadenus venenosus are usually present. The moss Racomitrium canescens with Selaginella wallacei cover most of the rocky ground surface. Pinus ponderosa, Pinus contorta, and Pseudotsuga menziesii are usually in the surrounding forests and may occur as isolated individual trees.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This is not the alpine/high subalpine *Danthonia intermedia* Herbaceous Vegetation (CEGL001794) association. This current type has more affinities with Northern Rocky Mountain or interior British Columbia vegetation.

Conservation Rank: S2

Rank Justification: This preliminary association occurs within a very narrow range of environments and is geographically restricted.

Pseudoroegneria spicata/Selaginella wallacei Herbaceous Vegetation

Bluebunch Wheatgrass Herbaceous Vegetation

Acronym: PSESPI

NatureServe Code: Provisional

<u>Macrogroup</u>: Northern Rocky Mountain-Vancouverian Mesic Grassland &

Forb Meadows

<u>Group:</u> Northern Rocky Mountain-Vancouverian Subalpine-Montane Mesic

Herbaceous Meadow

<u>Alliance</u>: Pseudoroegernia spicata - Danthonia intermeida Herbaceous

Vegetation (Provisional)

Classification Confidence Level: 3

Range: This association occurs in the North Cascades; most commonly on the east side. The association also exists in the northern Rocky Mountains.

Plots: 2, MORA (0), NOCA (2), OLYM (0), Other (0)

Environmental Description: This association occurs on dry balds within forests and woodlands. As sampled, it appears between 575-670 m (1990-2200 ft) elevation on steep southeasterly aspects.

<u>Vegetation Description</u>: The relatively open vegetation is dominated by Pseudoroegneria (=Agropyron) spicata. Achillea millefolium, Collinsia parviflora and Polygonum douglasii occurred in the two documented plots. Bromus marginatus, Selaginella wallacei, Paxistima (=Pachistima) myrsinites and Philadelphus lewisii appear prominently in one plot. Mosses, particularly Racomitrium canescens, are abundant on exposed rock in both sites. The forest surrounding this bald is dominated by Pseudotsuga menziesii and Pinus contorta.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This provisional association may be represented in British Columbia, the eastern Cascades, or the central Columbia River gorge in Washington. Although floristically similar, this association is defined as different, primarily by its forest landscape setting, from the widespread *Pseudoroegneria spicata* (CEGL001660) grasslands in the non-forest zones of the interior Pacific Northwest. The Columbia Basin grassland have more "shrubsteppe" species, such as *Artemisia tridentata* and *Chrysothamnus* spp.

Conservation Rank: SUQ

Rank Justification: Insufficient information exists to rank this tentative association.

Range: This association occurs at Mount Rainier National Park, the North Cascades and less commonly in the

Olympic Mountains.

Plots: 11, MORA (6), NOCA (1), OLYM (1), Other (3)

<u>Environmental Description</u>: This subalpine meadow association is found on moderately steep, mostly northeast and east slopes with well-drained soils.

Vegetation Description: These variably dense herbaceous

meadows often occur near *Abies lasiocarpa* tree islands. They are always co-dominated by *Valeriana sitchensis*, which is usually the most abundant species. *Festuca viridula*, *Ligusticum grayi*, and *Lupinus (arcticus ssp. subalpinus, latifolius)* are prominent to co-dominant. *Arnica latifolia*, *Castilleja parviflora*, *Carex nigricans*, *Erigeron peregrinus*, *Luzula glabrata var. hitchcockii*, *Polygonum bistortoides* or *Pulsatilla occidentalis* are other herbaceous species usually present in this diverse community.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is similar to the *Festuca viridula-Lupinus (arcticus, latifolius)* and *Festuca viridula-Eucephalus ledophyllus* associations. The later grassland associations lack high cover of *Valeriana* and generally appear on in drier locations.

Conservation Rank: S2S3

<u>Rank Justification</u>: This association occurs in the Olympic and Cascade Mountains in a narrow environmental range. Climate change will likely affect this vegetation.

Xerophyllum tenax Herbaceous Vegetation

Beargrass Herbaceous Vegetation

Acronym: XERTEN

NatureServe Code: CEGL005859

Macrogroup: Northern Rocky Mountain-Vancouverian Mesic Grassland & Forb

Meadows

Group: Northern Rocky Mountain-Vancouverian Subalpine-Montane Mesic

Herbaceous Meadow

<u>Alliance</u>: Xerophyllum tenax Meadow <u>Classification Confidence Level</u>: 2

Range: This association may occur in the Cascade or Olympic Mountains.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This association often occurs in areas that have experienced past fire. Although evidence is often old, the burns appear to have been intense and occurred in primarily closed forest conditions.

Photo Not Available

<u>Vegetation Description</u>: As paraphrased from NatureServe: "This association is a monoculture of *Xerophyllum tenax* (greater than 70% average cover) forming tall, dense tussocks rising to 0.3 m (1 foot). Over 90 vascular species occur within this association; about 20% of these are shrubs which never comprise more than 10% cover in the aggregate and of which only *Vaccinium membranaceum* attains greater than 50% constancy. Tree species, mostly *Abies lasiocarpa* in the tall-shrub layer, may occur sparsely scattered. The only graminoid of consequence is *Carex geyeri*, though its cover seldom exceeds 5%. Though diverse, the herbaceous component has only six species (exclusive of *Xerophyllum tenax*) with more than 50% constancy, including *Erigeron peregrinus*, *Valeriana sitchensis*, *Veratrum viride*, *Erythronium grandiflorum*, *Thalictrum occidentale*, and *Chamerion* (= *Epilobium*) *angustifolium*. Generally this forb component does not exhibit more than 10% cover, and should the first three named forbs exceed this cover, then another association is possibly indicated."

USFWS Wetland System: Not applicable.

<u>Comments</u>: This is not represented in the current data for national parks in Washington. As described in Glacier National Park, the *Xerophyllum tenax* association (CEGL005859) has less than 10% woody species cover. *Xerophyllum tenax*-dominated sites with over 10% woody cover are found in various *Vaccinium membranaceum*, *Vaccinium deliciosum*, *Vaccinium caespitosum*, and *Vaccinium scoparium* associations. See descriptions for each of those shrub or dwarf-shrub types.

Conservation Rank: SU

Rank Justification: Insufficient information exists to assess the conservation rank of this association.

<u>Alliance</u>: Amelanchier alnifolia Shrubland Classification Confidence Level: 3

 $\underline{\textbf{Range}}\text{: This association is described from a single location}$

in the North Cascades.

Plots: 1, MORA (0), NOCA (1), OLYM (0), Other (0)

Environmental Description: This association was sampled from an unforested bald at 1530 m (5020 ft) on a dry, steep, southeast aspect. The site is surrounded by a forest dominated by *Abies lasiocarpa* and *Cupressus nootkatensis*.

<u>Vegetation Description</u>: This site is a dense shrubland co-dominated by *Amelanchier alnifolia* and *Paxistima* (=Pachistima) myrsinites. The ground cover is dense and dominated by *Calamagrostis rubescens* and *Carex geyeri* with *Lupinus* (arcticus ssp. subalpinus, latifolius), *Phlox diffusa*, *Erythronium grandiflorum* and *Arctostaphylos uva-ursi* present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This provisional association is similar to the *Amelanchier alnifolia /* (Mixed Grass, Forb) association (CEGL005885) in the Northern Rockies of Montana and may represent its North Pacific floristic variant.

Conservation Rank: S2S4Q

<u>Rank Justification</u>: This tentative association is likely to be more widespread in the eastern Cascades and Okanogan Highlands. Fire suppression and tree invasion may be a threat in portions of the range.

Juniperus communis-(Phlox diffusa) Dwarf-shrubland

Common Juniper-(Spreading Phlox) Dwarf-shrubland

<u>Acronym</u>: JUNCOM-(PHLDIF) <u>NatureServe Code</u>: Preliminary

Macrogroup: Northern Rocky Mountain - Vancouverian Montane Shrubland

Group: Northern Rocky Mountain-Vancouverian Subalpine-Montane Mesic

Shrubland

Alliance: Juniperus communis Dwarf-shrubland

Classification Confidence Level: 3

Range: This association is broadly described from the Olympic and

Cascade Mountains.

Plots: 40, MORA (1), NOCA (0), OLYM (35), Other (4)

Environmental Description: This preliminary association occurs from low montane elevations up to the lower alpine zone. It occurs on all aspects and moist slopes. Soils are usually rocky or shallow and may have exposed mineral soil and bedrock.

<u>Vegetation Description</u>: Juniperus communis is the most abundant species in this dwarf-shrubland. *Phlox diffusa* is its most frequent companion, generally with low cover. *Achillea millefolium*, *Lupinus (arcticus ssp. subalpinus, latifolius)*, and *Trisetum spicatum* are other common associates. Associated species vary with elevation from species found in lowland balds to characteristically alpine species.

USFWS Wetland System: Not applicable.

Comments: This preliminary association has also been observed in the southern Cascades of Washington.

Conservation Rank: S3S4

<u>Rank Justification</u>: This association occurs within a broad range of environments with few threats on protected land. Tree invasion is a threat at some sites.

Environmental Description: This association occurs at middle to subalpine elevations on sites that tend to be southerly aspects on steep slopes, avalanche tracks and dry streambeds.

Vegetation Description: The open, deciduous shrub layer

is dominated by *Rubus parviflorus*. The herbaceous layer has abundant cover and diversity. The most abundant herbs are *Chamerion (=Epilobium) angustifolium, Pteridium aquilinum, Valeriana sitchensis* (mostly subalpine), *Veratrum viride* (mostly subalpine), and *Viola glabella*.

USFWS Wetland System: Not applicable.

Comments: The full variation of this association has not been sampled.

Conservation Rank: S3S4

Rank Justification: This association appears to be widespread and resilient to site disturbance.

Synonyms:

Rubus parviflorus/Chamerion angustifolium Shrubland; Chappell 2005 Rubus parviflorus/Epilobium angustifolium Community Type; Douglas 1972

Rubus parviflorus-Rubus spectabilis Shrubland

Thimbleberry-Salmonberry Shrubland

<u>Acronym</u>: RUBPAR-RUBSPE **NatureServe Code**: Provisional

<u>Macrogroup</u>: Northern Rocky Mountain - Vancouverian Montane Shrubland <u>Group</u>: Northern Rocky Mountain-Vancouverian Subalpine-Montane Mesic

Shrubland

<u>Alliance</u>: Rubus parviflorus Shrubland <u>Classification Confidence Level</u>: 3

Range: This association is sampled in the North Cascades and Mount Rainier

National Park.

Plots: 2, MORA (1), NOCA (1), OLYM (0), Other (0)

Environmental Description: This type has been sampled on both a dry riparian

terrace and a bald within a forest landscape.

Vegetation Description: Rubus parviflorus is the most abundant plant. It occurs

with other shrubs, including Rubus spectabilis, Symphoricarpos albus and Sorbus sitchensis. The forbs Angelica arguta, Maianthemum (=Smilacina) racemosum, Hydrophyllum fendleri, and Viola glabella were found at both plots.

USFWS Wetland System: Not applicable.

Comments: This is a provisional *Rubus parviflorus* type.

Conservation Rank: SUQ

Rank Justification: Insufficient information exists to fully characterize or rank this provisional type although it appears to be

widespread and resilient to site disturbance.

Spiraea splendens Shrubland

Mountain Spiraea Shrubland

Acronym: SPISPL

NatureServe Code: Provisional

Macrogroup: 2. Northern Rocky Mountain - Vancouverian

Montane Shrubland

Group: Northern Rocky Mountain-Vancouverian Subalpine-

Montane Mesic Shrubland

<u>Alliance</u>: Spiraea splendens Shrubland Classification Confidence Level: 3

Range: This association was sampled in the Olympic and

Cascade Mountains.

Plots: 5, MORA (0), NOCA (1), OLYM (4), Other (0)

Environmental Description: Sites vary between 1460 and 1770 m (4800 and 5800 ft) elevation and on steep slopes (55-70%). Sites are described as a rocky knoll, a bench, and a cirque wall.

<u>Vegetation Description</u>: Spiraea splendens (=densiflora) is

the dominant shrub in this moderately dense to closed shrubland association. *Juniperus communis, Rubus spectabilis, Vaccinium membranaceum*, or *Vaccinium ovalifolium* can be prominent but always with much less cover than *Spiraea splendens*. Other frequently occurring species include *Carex spectabilis, Erigeron peregrinus, Polygonum bistortoides, Juncus parryi, Lupinus (arcticus* ssp. *subalpinus, latifolius*), and *Valeriana sitchensis*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This is a provisional association with a wide ecological range. *Spiraea splendens* is also associated with wetlands dominated by *Carex lenticularis*.

Conservation Rank: S3S4Q

Rank Justification: This provisional association occurs within a wide environmental range on sites that have few threats.

Symphoricarpos albus-Malus fusca Shrubland

Common Snowberry-Western Crabapple Shrubland

<u>Acronym</u>: SYMALB-MALFUS <u>NatureServe Code</u>: Provisional

<u>Macrogroup</u>: Vancouverian Flooded & Swamp Forest <u>Group</u>: Northern Rocky Mountain-Vancouverian Subalpine-

Montane Mesic Shrubland

Alliance: Symphoricarpos albus Shrubland

Classification Confidence Level: 3

 $\underline{\textbf{Range}} \colon \mathsf{This} \ \mathsf{association} \ \mathsf{is} \ \mathsf{described} \ \mathsf{from} \ \mathsf{the} \ \mathsf{Olympic}$

Mountains.

Plots: 2, MORA (0), NOCA (0), OLYM (2), Other (0)

<u>Environmental Description</u>: This association occurs in avalanche chutes at mid-elevations on gentle to moderate slopes. It appears both within the track and at the debris apron at the base of chutes.

<u>Vegetation Description</u>: This dense shrubland is dominated by *Symphoricarpos albus*. Other common shrubs

include Malus (=Pyrus) fusca, Alnus viridis ssp. sinuata, Holodiscus discolor, Prunus emarginata and Amelanchier alnifolia. Pseudotsuga menziesii and Abies lasiocarpa dominate the surrounding forests.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S2S4Q

Rank Justification: This tentative association occurs within a narrow environmental range on sites that have few threats.

Symphoricarpos hesperius Dwarf-Shrubland

Trailing Snowberry Dwarf-shrubland

Acronym: SYMHES

NatureServe Code: Provisional

<u>Macrogroup</u>: Northern Rocky Mountain - Vancouverian Montane Shrubland <u>Group</u>: Northern Rocky Mountain-Vancouverian Subalpine-Montane Mesic

Shrubland

Alliance: Symphoricarpos hesperius Dwarf Shrubland

Classification Confidence Level: 3

Range: This association is described from the Olympic Mountains and may occur

in the Cascades.

Plots: 1, MORA (0), NOCA (0), OLYM (1), Other (0)

Environmental Description: This association was sampled at 1100 m (3600 ft) on a 22% slope near an avalanche track.

<u>Vegetation Description</u>: This dense shrubland is dominated by *Symphoricarpos*

hesperius (=mollis). Other shrubs include Rosa nutkana and Alnus viridis ssp. sinuata. Hydrophyllum fendleri, Heracleum maximum (=lanatum), Thalictrum occidentale and Carex hoodii also occur with high percent cover. The tree species Abies lasiocarpa and Cupressus (=Chamaecyparis) nootkatensis also appear.

USFWS Wetland System: Not applicable.

Comments: This is a provisional type that needs more sampling.

Conservation Rank: S2S4Q

Rank Justification: Insufficient information exists to rank this tentative association.

Vaccinium caespitosum/Festuca viridula Dwarf-shrubland

Dwarf Huckleberry-Green Fescue Dwarf-shrubland

<u>Acronym</u>: VACCAE/FESVIR <u>NatureServe Code</u>: Provisional

Macrogroup: Northern Rocky Mountain - Vancouverian

Montane Shrubland

Group: Northern Rocky Mountain-Vancouverian Subalpine-

Montane Mesic Shrubland

Alliance: Vaccinium (caespitosum, membranaceum,

scoparium) Dwarf-shrubland

Classification Confidence Level: 3

Range: This association is described from the North Cascades and occurs elsewhere in the eastern Cascade Mountains.

Plots: 3, MORA (0), NOCA (3), OLYM (0), Other (0)

<u>Environmental Description</u>: This association occurs in the subalpine parkland at high elevations on gentle slopes that are well-drained. It can occur within tree islands. Fire plays a

role in this association as evidenced by charred stumps and charcoal.

<u>Vegetation Description</u>: This dwarf-shrubland is dominated by *Vaccinium caespitosum*. The herb community is diverse and includes high cover of *Erigeron peregrinus*, *Festuca viridula*, *Arenaria capillaris*, *Antennaria lanata*, *Potentilla flabellifolia* and *Ligusticum grayi*. *Abies lasiocarpa*, *Picea engelmannii* and *Larix lyallii* seedlings are commonly encountered.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Because this provisional association contains similar species to the *Vaccinium (caespitosum, scoparium)* Dwarfshrubland (CEGL001140) in the Rocky Mountains it potentially could be generalized into that type.

Conservation Rank: S2S3Q

<u>Rank Justification</u>: Little information exists for this provisional association to assess its conservation rank. The paucity of data and observations suggest that it is not common.

Vaccinium caespitosum-Xerophyllum tenax Dwarf-shrubland

Dwarf Huckleberry-Beargrass Dwarf-shrubland

<u>Acronym</u>: VACCAE-XERTEN

NatureServe Code: Provisional

<u>Macrogroup</u>: Northern Rocky Mountain - Vancouverian Montane Shrubland <u>Group</u>: Northern Rocky Mountain-Vancouverian Subalpine-Montane Mesic

Shrubland

Alliance: Vaccinium (caespitosum, membranaceum, scoparium) Dwarf-shrubland

Classification Confidence Level: 3

Range: This sample is described from the Olympic Mountains.

Plots: 1, MORA (0), NOCA (0), OLYM (1), Other (0)

Environmental Description: This sample occurs on a gentle south aspect at 1490

m (4900 ft) elevation.

<u>Vegetation Description</u>: This dwarf-shrubland is dominated by *Vaccinium caespitosum* and the evergreen bunch-forb *Xerophyllum tenax*. Few other forbs are present. *Tsuga mertensiana* seedlings are present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This might be included in a generalized type consisting of *Xerophyllum tenax* herbland with shrubs. See comments in the *Vaccinium deliciosum* (CEGL001427) and *Vaccinium scoparium* (provisional) associations.

Conservation Rank: SUQ

<u>Rank Justification</u>: Insufficient information exists to assess this tentative association.

Vaccinium deliciosum-Festuca viridula Dwarf-shrubland

Blueleaf Huckleberry-Green Fescue Dwarf-shrubland

<u>Acronym</u>: VACDEL-FESVIR <u>NatureServe Code</u>: Preliminary

Macrogroup: Northern Rocky Mountain - Vancouverian

Montane Shrubland

Group: Northern Rocky Mountain-Vancouverian Subalpine-

Montane Mesic Shrubland

Alliance: Vaccinium (caespitosum, membranaceum,

scoparium) Dwarf-shrubland

Classification Confidence Level: 3

Range: This association occurs in the Cascade Mountains.

Plots: 6, MORA (2), NOCA (1), OLYM (0), Other (3)

Environmental Description: This association occurs in subalpine grasslands and parklands that primarily have *Abies lasiocarpa* tree islands. Evidence of fire may be present. Sites can be rolling gentle slopes to exposed ridge tops.

<u>Vegetation Description</u>: The dwarf-shrub layer is dominated by *Vaccinium deliciosum* with a herbaceous layer dominated by *Festuca viridula*. When present, other shrubs, primarily *Phyllodoce empetriformis* and *Juniperus communis*, usually display less than 10% cover. Frequently occurring, sometimes prominent herbaceous species include *Lupinus (arcticus* ssp. subalpinus, latifolius), Veratrum viride, Eucephalus (=Aster) ledophyllus, Valeriana sitchensis, Ligusticum grayi, Phlox diffusa, Arnica latifolia, and Luzula glabrata var. hitchcockii. Abies lasiocarpa is usually present to prominent.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This could be interpreted as a variant of either the *Vaccinium deliciosum* dwarf-shrub association, the *Festuca viridula* herbaceous association or an early developmental stage of an *Abies lasiocarpa* woodland association. Two plots with high percent cover of *Juniperus communis* are closely related to the preliminary *Juniperus communis-(Phlox diffusa)* association.

Conservation Rank: S2S3

<u>Rank Justification</u>: This preliminary association apparently occurs in the high Cascades in narrow environmental range between subalpine heather and drier subalpine grasslands. Climate change will likely affect this vegetation.

Vaccinium scoparium Dwarf-shrubland

Red Huckleberry Dwarf-shrubland

Acronym: VACSCO

NatureServe Code: Provisional

Macrogroup: Northern Rocky Mountain - Vancouverian

Montane Shrubland

Group: Northern Rocky Mountain-Vancouverian Subalpine-

Montane Mesic Shrubland

Alliance: Vaccinium (caespitosum, membranaceum,

scoparium) Dwarf-shrubland

Classification Confidence Level: 3

Range: This association occurs in the Cascade Mountains

and is likely in the Rocky Mountains.

Plots: 4, MORA (2), NOCA (0), OLYM (0), Other (2)

Environmental Description: This association occurs between 1735-2200 m (5700 and 7200 ft) elevations on generally steep, southwestern slopes that often have

evidence of past burning.

Vegetation Description: This patchy, dwarf-shrub vegetation is dominated by Vaccinium scoparium. Other shrubs such as Vaccinium deliciosum, Vaccinium membranaceum, and Paxistima (=Pachistima) myrsinites are sometimes present but always in less abundance than Vaccinium scoparium. Lupinus (arcticus ssp. subalpinus, latifolius), Arnica latifolia, Phlox diffusa and Festuca viridula can be prominent to co-dominant. Scattered short trees are usually Abies lasiocarpa.

USFWS Wetland System: Not applicable.

Comments: Three additional plots, co-dominated by Vaccinium scoparium and Festuca viridula, are considered a variant of this generalized type. They appear in the table as VACSCO/FESVIR. One MORA plot is co-dominated by Xerophyllum tenax and with more extensive sampling may be recognized as a separate entity; see the provisional Vacccinium caespitosum/Xerophyllum tenax association. These could be generalized into the Vaccinium (caespitosum, scoparium) Dwarfshrubland (CEGL001140) which is recognized in the Rocky Mountains.

Conservation Rank: S2S4Q

Rank Justification: This provisional association occurs at Mount Rainier National Park although it likely occurs elsewhere in the east Cascades and northern Rockies.

Vaccinium membranaceum/Phlox diffusa Dwarf-shrubland

Big Huckleberry/Spreading Phlox Dwarf-shrubland

<u>Acronym</u>: VACMEM/PHLDIF <u>NatureServe Code</u>: Preliminary

Macrogroup: Northern Rocky Mountain-Vancouverian Mesic Grassland & Forb

Meadows

Group: Northern Rocky Mountain-Vancouverian Subalpine-Montane Mesic

Shrubland

Alliance: Vaccinium membranaceum/Phlox diffusa Dwarf-shrubland

Classification Confidence Level: 3

Range: This association occurs in the Olympic and possibly the Cascade

Mountains.

Plots: 8, MORA (0), NOCA (0), OLYM (8), Other (0)

Environmental Description: This association is known to occur at 1520-1830 m (5000-6000 ft) elevation on moderately steep slopes with rocky substrates. The soil surface is often covered with litter and other organic material.

<u>Vegetation Description</u>: The shrubland is open or patchy and dominated by short-stature *Vaccinium membranaceum*. *Phlox diffusa* typically has similar cover to *Vaccinium membranaceum*. *Paxistima* (=Pachistima) myrsinites is occasionally abundant. *Silene parryi*, *Moehringia* (=Arenaria) macrophylla, *Poa cusickii*, *Lomatium martindalei*, *Sedum divergens* and other rocky site species can also occur.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S3S4

Rank Justification: This preliminary association occurs in the Olympic Mountains in a specific habitat with few threats. It may

occur in the Cascades.

Vaccinium membranaceum Shrubland

Big Huckleberry Shrubland

Acronym: VACMEM

NatureServe Code: Preliminary

Macrogroup: Northern Rocky Mountain - Vancouverian

Montane Shrubland

Group: Northern Rocky Mountain-Vancouverian Subalpine-

Montane Mesic Shrubland

Alliance: Vaccinium membranaceum Shrubland

Classification Confidence Level: 3

Range: This association occurs in the Cascade and Olympic

Mountains.

Plots: 25, MORA (8), NOCA (2), OLYM (15), Other (0)

<u>Environmental Description</u>: This association occurs at middle to high elevations typically on southerly to west aspects. Sites are topographically dry on gentle to steep slopes and often have evidence of past fires. Soils can be rocky with some exposed mineral soil.

<u>Vegetation Description</u>: This shrub association varies in both height and cover but is always is dominated by *Vaccinium membranaceum*. Other shrubs such as *Sorbus sitchensis*, *Vaccinium scoparium* and *Paxistima* (=Pachistima) myrsinites are less prominent. *Lupinus* (arcticus ssp. subalpinus, latifolius) is present to prominent along with a variety of other herbaceous species, such as *Arnica latifolia*, *Polygonum bistortoides*, or *Valerican sitchensis*. *Xerophyllum tenax* displays less than 10% cover or is absent. Several trees species can be present but *Abies lasiocarpa* is most frequent.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Shrublands dominated by *Vaccinium membranaceum* were historically burned by native Americans to enhance berry production and retard tree invasion (Arnett and Crawford 2007).

Conservation Rank: S4

Rank Justification: This preliminary association is widespread in the mountains of western Washington. Fire suppression has allowed tree invasion into many occurrences.

Synonyms:

Vaccinium membranaceum Community Type; Henderson et al. 1979 Vaccinium/Xerophyllum Community Type; Henderson 1974

Vaccinium membranaceum/Calamagrostis rubescens Shrubland

Big Huckleberry/Pinegrass Shrubland

<u>Acronym</u>: VACMEM/CALRUB <u>NatureServe Code</u>: Provisional

Macrogroup: Northern Rocky Mountain - Vancouverian

Montane Shrubland

Group: Northern Rocky Mountain-Vancouverian Subalpine-

Montane Mesic Shrubland

Alliance: Vaccinium membranaceum Shrubland

Classification Confidence Level: 3

Range: This association occurs in the eastern Cascade Mountains and is likely to occur the Northern Rocky Mountains.

Plots: 1, MORA (0), NOCA (1), OLYM (0), Other (0)

Environmental Description: This association occurs at middle to high elevations, typically on southerly to west aspects. Sites are topographically dry, gentle to steep slopes and often have evidence of past fires. Soils can be

rocky with some exposed mineral soil. Evidence of browsing is common.

<u>Vegetation Description</u>: This variable height shrub association is dominated by *Vaccinium membranaceum*. Other shrubs, such as *Paxistima* (=*Pachistima*) myrsinites, *Spiraea betulifolia*, *Amelanchier alnifolia*, *Rosa gymnocarpa*, and *Sorbus sitchensis* are less prominent. *Calamagrostis rubescens* is present to co-dominant with a variety of other herbaceous species. *Carex geyeri* may be present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is tentatively recognized pending further sampling. This provisional association is represented by a single plot in the North Cascades. As conceptualized, this association includes all *Vaccinium membranaceum*-dominated shrublands in the east Cascades and northern Rocky Mountains without *Xerophyllum tenax*. Further sampling and comparison regionally is needed to verify this association or a variant of a regional shrubland. Fire suppression has allowed tree invasion into many occurrences.

Conservation Rank: S2S4Q

Rank Justification: Insufficient information exists to rank this provisional association.

Vaccinium membranaceum/Xerophyllum tenax Shrubland

Big Huckleberry/Beargrass Shrubland

<u>Acronym</u>: VACMEM/XERTEN <u>NatureServe Code</u>: CEGL005891

Macrogroup: Northern Rocky Mountain - Vancouverian

Montane Shrubland

Group: Northern Rocky Mountain-Vancouverian Subalpine-

Montane Mesic Shrubland

Alliance: Vaccinium membranaceum Shrubland

Classification Confidence Level: 2

Range: This association occurs in the Cascade, Olympic

and Northern Rocky Mountains.

Plots: 9, MORA (6), NOCA (0), OLYM (3), Other (0)

Environmental Description: This association occurs at 1300-1555 m (4300-5100ft) elevation on moderately steep slopes with southerly aspects. Evidence of past fire is

present at many sites.

Vegetation Description: The vegetation is dense and

dominated by the evergreen forb *Xerophyllum tenax* and the shrub *Vaccinium membranaceum*. Other shrubs, such as *Paxistima* (=*Pachistima*) *myrsinites* and *Sorbus sitchensis* may be present to prominent. *Lupinus* (*arcticus* ssp. *subalpinus*, *latifolius*), *Rubus lasiococcus*, and *Chamerion* (= *Epilobium*) *angustifolium* appear in most plots, generally with low cover. Scattered, short trees are common and typically include *Abies lasiocarpa*, *Cupressus* (=*Chamaecyparis*) *nootkatensis* or *Pseudotsuga menziesii*.

USFWS Wetland System: Not applicable.

Comments: This is also known from lower, montane elevations (e.g. *Abies amabilis* zone) in the southern Cascades.

Conservation Rank: S2S3

<u>Rank Justification</u>: This association occurs in the mountains of Washington. Fire suppression has allowed trees to invade into many occurrences.

Synonyms:

Acronym: ARC(NEV, UVA)/PAXMYR

NatureServe Code: Provisional

Macrogroup: Northern Rocky Mountain Lowland Grassland

& Shrubland

Group: Northern Rocky Mountain Montane-Foothill

Deciduous Shrubland

Alliance: Arctostaphylos uva-ursi Dwarf-shrubland Alliance

Classification Confidence Level: 3

Range: This association occurs in the North Cascades.

Plots: 2, MORA (0), NOCA (2), OLYM (0), Other (0)

Environmental Description: This middle elevation association appears in rocky balds within a matrix woodland or open forest dominated by *Pinus ponderosa* and

or open forest dominated by *Pinus ponderosa* and *Pseudotsuga menziesii*. Exposed bedrock is common in the

balds.

Vegetation Description: This association is co-dominated

by Arctostaphylos uva-ursi or A. nevadensis, and Paxistima (=Pachistima) myrsinites. The herbaceous component generally consists of Arenaria capillaris, Pseudoroegneria (=Agropyron) spicatum, Calamagrostis rubescens and/or Balsamorhiza sagittata.

USFWS Wetland System: Not applicable.

<u>Comments</u>: The two plots representing this provisional association may represent two different communities more common in the east Cascades and Rocky Mountains. Further samping and comparison is needed to clarify these relationships. The *Arctostaphylos uva-ursi / Pseudoroegneria spicatum* association (CEGL005831) is similar in dominance but varies in associated species and occurs at higher elevations.

Conservation Rank: S3Q

Rank Justification: This provisional association may have limited range and could be negatively impacted by exotic species (*Bromus tectorum*).

Arctostaphylos uva-ursi-Fragaria virginiana-(Festuca roemeri) Dwarf-shrubland

Kinnikinnick-Virginia Strawberry-(Roemer's fescue) Dwarf-shrubland

Acronym: ARCUVA-FRAVIR-(FESROE)

NatureServe Code: Preliminary

Macrogroup: Vancouverian Lowland Grassland &

Shrubland

<u>Group</u>: North Pacific Herbaceous Bald and Bluff <u>Alliance</u>: *Arctostaphylod uva-ursi* Dwarf-shrubland

Classification Confidence Level: 2

Range: This association occurs in the Cascade and Olympic

Mountain foothills and the Puget Lowland.

Plots: 1, MORA (0), NOCA (1), OLYM (0), Other (0)

Environmental Description: This association appears as patches within shallow-soiled, very dry balds located in forests at lower to middle elevations. It occurs mostly on moderately steep slopes (up to 75% slope) or on gentle benches. Topographic position is mostly upper slopes, but can be found ridgetops and mid-slopes.

<u>Vegetation Description</u>: This association is typically dominated by dwarf-shrubs, which always occupy at least 25% cover. Arctostaphylos uva-ursi is the dominant dwarf-shrub. Juniperus communis and Arctostaphylos nevadensis are absent. Festuca roemeri (=idahoensis) is usually present (Olympic Mountains and Puget Lowlands only) and sometimes co-dominant. Fragaria virginiana is usually present and prominent. Eriophyllum lanatum, Luzula (comosa, multiflora), and Zigadenus venenosus are often present.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S3

<u>Rank Justification</u>: This association seems to be common within the limited habitat of balds and rock outcrops in the Olympics and northern Cascades. There may be some long-term threat from tree invasion and non-native species. **Synonyms**:

Arctostaphylos uva-ursi-Fragaria virginiana-(Festuca roemeri); Chappell 2006a

Bromus vulgaris-Festuca subulata Herbaceous Vegetation

Columbia brome-Bearded Fescue Herbaceous Vegetation

<u>Acronym</u>: BROVUL-FESSUB <u>NatureServe Code</u>: Provisional

Macrogroup: Vancouverian Lowland Grassland & Shrubland

<u>Group</u>: North Pacific Herbaceous Bald and Bluff <u>Alliance</u>: *Bromus vulgaris* Herbaceous Vegetation

Classification Confidence Level: 3

Range: This type is based on a single plot from the Olympic Mountains but it may

occur in the Cascades.

Plots: 1, MORA (0), NOCA (0), OLYM (1), Other (0)

Environmental Description: The plot is located on a debris slide at 990 m (3250 ft) elevation with a southwest aspect. Litter covers the unvegetated ground surface.

<u>Vegetation Description</u>: This early successional herbaceous community is dominated by *Bromus vulgaris* and *Festuca subulata. Fragaria vesca*, *Osmorhiza*

purpurea, Trifolium latifolium and Polystichum munitum are other associates. Scattered shrubs with low percent cover include Acer circinatum, Holodiscus discolor, and Rubus leucodermis. Snags and scattered Thuja plicata and Tsuga heterophylla are prominent and indicate a trend in stand development. Moss dominates the ground cover.

USFWS Wetland System: Not applicable.

Comments: This may be early-seral vegetation that is not stable enough to represent an association.

Conservation Rank: S2S5Q

Rank Justification: The provisional association may occur within a limited geographic range and environment. The known

site is in a protected area.

Festuca roemeri-Cerastium arvense-Koeleria macrantha Herbaceous Vegetation

Roemer's Fescue-Field Chickweed-Prairie Junegrass Herbaceous Vegetation

Acronym: FESROE-CERARV-KOEMAC

NatureServe Code: CEGL003349

Macrogroup: Vancouverian Lowland Grassland &

Shrubland

Group: North Pacific Herbaceous Bald and Bluff

Alliance: Festuca roemeri - Agrostis pallens - Koeleria

macrantha Herbaceous Vegetation

Classification Confidence Level: 1

<u>Range</u>: This association occurs in the Puget Lowlands, in the western Columbia River Gorge, and on the north-central to northeastern Olympic Peninsula.

Plots: 2, MORA (0), NOCA (0), OLYM (2), Other (0)

<u>Environmental Description</u>: This association occurs in herbaceous balds surrounded by *Pseudotsuga menziesii – Tsuga heterophylla* forests. Sites have shallow soils and are on sunny aspects and very dry sites.

<u>Vegetation Description</u>: This grassland is dominated or co-dominated by *Festuca roemeri. Mahonia aquifolium* occurs in about half the Puget Lowland plots with a maximum of 20% cover. *Arctostaphylos uva-ursi* is occasionally prominent. Frequent, native herbaceous species include *Koeleria macrantha* (=cristata), Luzula (comosa, multiflora), Achillea millefolium, Eriophyllum lanatum, Cerastium arvense, Zigadenus venenosus, Fritillaria lanceolata, Lotus micranthus, and Lomatium utriculatum. Selaginella wallacei (habit similar to a moss) is usually present on small rock outcrops within the association. The native grasses *Danthonia californica*, *Bromus sitchensis*, and *Agrostis pallens* (=diegoensis) occasionally are prominent to even co-dominant.

USFWS Wetland System: Not applicable.

<u>Comments</u>: High elevation subalpine sites with similar vegetation but with *Oxytropis monticola* and *Phlox diffusa* are not included here, instead they are included in the *Festuca roemeri - Phlox diffusa* Herbaceous (CEGL001622).

Conservation Rank: S1

Rank Justification: There are few occurrences in Washington and many of them are threatened by invasion and increase of non-native species. Other threats include development, road-building, fire suppression effects, and recreational impacts. **Synonyms**:

Festuca roemeri-Plectritis congesta Herbaceous Vegetation

Roemer's Fescue-Rosy Plectritis

<u>Acronym</u>: FESROE-PLECON <u>NatureServe Code</u>: Preliminary

Macrogroup: Vancouverian Lowland Grassland &

Shrubland

Group: North Pacific Herbaceous Bald and Bluff

Alliance: Festuca roemeri - Agrostis pallens - Koeleria

macrantha Herbaceous Vegetation Classification Confidence Level: 2

Range: This association occurs in the Puget Lowlands and

in the Elwha drainage of Olympic Mountains.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This low elevation herbaceous bald association occurs in microsite features that are moist in the spring but very dry later in the summer. They consist of the partially shaded portions or edges of balds or seasonally moist (but not the wettest) microsites within more

extensive balds. These balds are found primarily on mid- to upper slopes, with southern to western aspects. Soils are shallow over sedimentary or volcanic bedrock. Rock outcrops (often covered with mosses) are typically present within or directly adjacent to the association. Soils are mostly loam in texture, but can be gravelly or sandy.

<u>Vegetation Description</u>: This association is dominated or co-dominated by the *Festuca roemeri. Plectritis congesta* is always prominent to co-dominant. *Collinsia grandiflora* is prominent to co-dominant in about half the plots, and *Prunella vulgaris* occurs in one-third of them. Mosses and lichens typically cover the space between grasses and forbs. Many other species occur.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This type was sampled on OLYM in the Elwha drainage during the Chappell (2006) Balds project. The summary of this association's data on and off OLYM appears in the synthesis table.

Conservation Rank: S1

Rank Justification: This association occurs at very few sites and most sites are threatened by the invasion of and/or increase in non-native species. Other threats include tree invasion, development, and recreational impacts. **Synonyms**:

Festuca roemeri-Plectritis congesta; Chappell 2006a; Chappell 2006b

Koeleria macrantha-(Agrostis pallens) Herbaceous Vegetation

Classification Confidence Level: 2

Range: This association is described from the southern Cascades of Washington and also occurs in the North Cascades.

Plots: 2, MORA (0), NOCA (2), OLYM (0), Other (0)

Environmental Description: This mid to low montane grassland association appears on slightly dry to moderately dry portions of balds within forest landscapes. These balds occur on moderate to very steep slopes, mostly facing east

to west (rarely other aspects). Almost all sites are on upper slopes, with an occasional mid-slope or ridgetop site as well.

<u>Vegetation Description</u>: This relatively open vegetation is dominated by *Koeleria macrantha (=cristata)*. *Vulpia (Festuca) myuros, Selaginella wallacei, Achillea millefolium, Eriophyllum lanatum, Cryptogramma acrostichoides (=crispa)* and *Zigadenus venenosus* occur in both plots. The moss, *Racomitrium canescens*, is dominant at the North Cascade locations. As described in the southern Cascades of Washington, *Agrostis pallens (=diegoensis)* can be co-dominant with the following species that are co-dominant to prominent: *Festuca rubra* (non-native), *Microseris laciniata, Zigadenus venenosus, Gilia capitata, Elymus glaucus, Bromus carinatus, Mahonia aquifolium, Allium cernuum, Lomatium dissectum,* and *Lomatium nudicaule*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This expands the concept of *Koeleria macrantha*-(*Agrostis pallens*) association Chappell (2006) to include sites farther north in the Cascades.

Conservation Rank: S1S2

Rank Justification: There are few occurrences in Washington. This association is threatened by invasion and increase of non-native species. Other possible threats include tree invasion due to fire suppression and recreational impacts.

Synonyms:

Koeleria macrantha-(Agrostis pallens); Chappell 2006a

Lomatium martindalei Lithomorphic Vegetation

Cascade Desert-parsley Lithomorphic Vegetation

<u>Acronym</u>: LOMMAR Lithomorphic <u>NatureServe Code</u>: Preliminary

Macrogroup: Vancouverian Cliff, Scree & Other Rock

Vegetation

Group: North Pacific Montane Massive Bedrock, Cliff and

Talus

Alliance: Lomatium martindalei Lithomorphic Vegetation

Classification Confidence Level: 3

Range: This association is described from the Cascades

and likely occurs in the Olympic Mountains.

Plots: 1, MORA (1), NOCA (0), OLYM (0), Other (0)

<u>Environmental Description</u>: This association occurs within herbaceous balds within forest landscapes at lower to middle elevations. The type occurs on dry microsites with very shallow soils.

Vegetation Description: This sparse to open vegetation

is dominated or co-dominated by Lomatium martindalei. Agrostis pallens (=diegoensis), Selaginella wallacei (moss like), and Phlox diffusa usually are present to prominent. If present, Phlox diffusa is never co-dominant. Eriophyllum lanatum, Polygonum douglasii, and Saxifraga ferruginea are usually present.

USFWS Wetland System: Not applicable.

Comments: Co-dominance of Phlox diffusa indicates a different association.

Conservation Rank: S2S3

Rank Justification: This preliminary association occurs within a narrow environmental range with few threats.

Synonyms:

Lomatium martindalei; Chappell 2006a

Blechnum spicant Herbaceous Vegetation

Deer Fern Herbaceous Vegetation

Acronym: BLESPI

NatureServe Code: Provisional

Macrogroup: Vancouverian Lowland Grassland & Shrubland

Group: North Pacific Hypermaritime Shrub and Herbaceous Headland

Alliance: Blechnum spicant Herbaceous Vegetation

Classification Confidence Level: 3

Range: This provisional type is based on a single plot from the Olympic Peninsula and is possible elsewhere in lowland western Washington.

Plots: 1, MORA (0), NOCA (0), OLYM (1), Other (0)

Environmental Description: No environmental data exists to further define this

plot.

<u>Vegetation Description</u>: This association is dominated by *Blechnum spicant* with no other species more abundant than present. Associated species are suggestive of a very wet climate (western Olympic Mountains).

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S2S5Q

Rank Justification: Insufficient information is available to provide a specific rank for this provisional association.

Synonyms:

Photo Not Available

Calamagrostis nutkaensis-Vicia nigra ssp. gigantea-(Equisetum telmateia) Herbaceous Vegetation

Pacific Reedgrass-Giant Vetch-(Giant Horsetail) Herbaceous Vegetation

<u>Acronym</u>: CALNUT-VICNIG-(EQUTEL) <u>NatureServe Code</u>: CEGL001564

Macrogroup: Vancouverian Lowland Grassland &

Shrubland

Group: North Pacific Hypermaritime Shrub and Herbaceous

Headland

Alliance: Calamagrostis nutkaensis-Elymus glaucus

Herbaceous Vegetation

Classification Confidence Level: 2

Range: This association occurs on the Olympic Peninsula.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This association occurs on coastal bluffs and is always adjacent to saltwater. Slopes are moderate to very steep, and subject to erosion.

<u>Vegetation Description</u>: The vegetation is dominated by *Calamagrostis nutkaensis*. In Washington, *Vicia nigra* ssp. *gigantea* is present in all plots sampled and can be co-dominant. *Equisetum telmateia* can be abundant, and *Carex obnupta* is sometimes present where seeps are present in the bald. Other frequent species include *Gaultheria shallon*, *Anaphalis margaritacea*, *Fragaria chiloensis*, *Epilobium ciliatum*, *Polystichum munitum*, *Rubus spectabilis*, and *Solidago canadensis*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: The global name (*Calamagrostis nutkaensis-Elymus glaucus* CEGL001564) comes from Oregon: in Washington, *Elymus glaucus* does not occur in this type. In addition, the Oregon vegetation has much less *Vicia nigra* ssp. *gigantea* and does not have wet-site indicators like *Equisetum telmateia*. This is not represented in the current plot data for national parks in Washington although WNHP has records of occurrences on the coastal strip of OLYM.

Conservation Rank: S1

<u>Rank Justification</u>: This association is localized in distribution and environment, and has few occurrences. This association occurs on unstable substrates and is therefore susceptible to both natural and human-caused disturbances.

Synonyms:

Calamagrostis nutkaensis-Vicia nigra ssp. gigantea-(Equisetum telmateia); Chappell 2006a

Gaultheria shallon Shrubland

Salal Shrubland

Acronym: GAUSHA

NatureServe Code: Provisional

Macrogroup: Vancouverian Lowland Grassland & Shrubland

Group: North Pacific Hypermaritime Shrub and Herbaceous Headland

<u>Alliance</u>: Gaultheria shallon Shrubland <u>Classification Confidence Level</u>: 3

Range: This association occurs on the Olympic Peninsula coastline, and

potentially in the Olympic and the Cascade Mountains. **Plots**: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This association is likely to occur at middle to lower

elevations.

<u>Vegetation Description</u>: The dense vegetation is dominated by *Gaultheria* shallon. Mahonia (=Berberis) nervosa, Chimaphila umbellata and Linnaea borealis are likely associated species.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is not represented in the current data for national parks in Washington. One of the authors (Chappell) has observed, but not sampled, *Gaultheria shallon-*dominated vegetation (often with *Vaccinium ovatum*) on coastal headlands and bluffs of Olympic National Park.

Conservation Rank: S2S4Q

<u>Rank Justification</u>: There is insufficient information to rank this provisional association.

Arctostaphylos columbiana Shrubland

Hairy Manzanita Shrubland

Acronym: ARCCOL

NatureServe Code: Preliminary

<u>Macrogroup</u>: Cool Semi-Desert Chaparral

<u>Group</u>: Western Cordillerian Montane Sclerophyll Scrub <u>Alliance</u>: *Arctostaphylos columbiana* Dwarf-shrubland

Classification Confidence Level: 2

Range: This association occurs on the northern and eastern side of the Olympic Mountains, in the Puget Lowland, and in the southern Cascades of Washington. It may also occur further north in the Cascades.

Plots: 4, MORA (0), NOCA (0), OLYM (4), Other (0)

Environmental Description: This association occurs at low to middle elevations on the slightly to moderately dry portions of open balds within a forest matrix. Slopes are moderate to steep, with south-southeast to west-southwest aspects. Topographic position is usually upper slope, although mid-slopes and ridgetops are also represented.

<u>Vegetation Description</u>: This association is typically dominated by at least 25% cover of shrubs that are taller than 0.5 m. <u>Arctostaphylos columbiana</u> is always the dominant shrub. The dwarf-shrub <u>Symphoricarpos hesperius</u> (=mollis) is usually prominent, and <u>Elymus glaucus</u> is usually present to prominent. <u>Carex inops</u> is occasionally prominent. <u>Arctostaphylos uva-ursi</u> or <u>Arctostaphylos nevadensis</u> (the latter only in the southern Cascades) are sometimes prominent. <u>Small Pseudotsuga menziesii</u> or <u>Juniperus scopulorum</u> are usually present (the latter only in the Olympics). Frequently occurring shrubs and dwarf-shrubs include <u>Amelanchier alnifolia</u>, <u>Mahonia aquifolium</u>, <u>Holodiscus discolor</u>, <u>Lonicera ciliosa</u>, <u>Paxistima</u> (=Pachistima) myrsinites, and <u>Rosa gymnocarpa</u>. Festuca occidentalis, <u>Castilleja hispida</u>, <u>Collomia heterophylla</u>, <u>Epilobium minutum</u>, <u>Fragaria virginiana</u>, <u>Achillea millefolium</u>, and <u>Eriophyllum lanatum</u> are the herbaceous species usually present.

USFWS Wetland System: Not applicable.

Comments: Recent taxonomic work has recognized Juniperus scopulorum west of the Cascades as J. maritimum.

Conservation Rank: S3

Rank Justification: This association occurs within a restricted ecological range and is threatened by tree encroachment.

Synonyms:

Arctostaphylos columbiana; Chappell 2006a

Ceanothus velutinus Shrubland

Snowbrush Shrubland

Acronym: CEAVEL

NatureServe Code: Provisional

Macrogroup: Cool Semi-Desert Chaparral

Group: Western Cordillerian Montane Sclerophyll Scrub

<u>Alliance</u>: <u>Ceanothus velutinus Shrubland</u> <u>Classification Confidence Level</u>: 3

 $\underline{\textbf{Range}} :$ This association occurs in the east % Range : and North

Cascades.

Plots: 10, MORA (0), NOCA (10), OLYM (0), Other (0)

Environmental Description: This association occurs between 760-1310 m (2500 and 4300 ft) elevation on southerly aspects with 20-60% slopes. Sites are on drier topographic positions. The substrate is often comprised of rocky soils and associated with rock outcrops. Most sites have evidence of recent fire.

<u>Vegetation Description</u>: The vegetation is dominated by *Ceanothus velutinus* with several other tall shrubs: *Acer glabrum*, *Amelanchier alnifolia*, *Prunus emarginata*, *Salix scouleriana* and/or *Sorbus scopulina*. Shorter shrubs such as *Paxistima* (=Pachistima) myrsinites, Spiraea betulifolia, Symphoricarpos albus and/or Rubus parviflorus frequently occur. Calamagrostis rubescens is the most common herbaceous species along with *Chamerion* (= Epilobium) angustifolium and/or *Maianthemum* (=Smilacina) racemosum. The presence of *Pseudotsuga menziesii* or *Abies lasiocarpa* is likely.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Additional plots may help describe geographic and environmental range variation of this preliminary type. The <u>Ceanothus velutinus - Prunus emarginata - Artemisia tridentata</u> association (CEGL003144) could serve as a placeholder for a regional type although it appears to be climatically drier.

Conservation Rank: S3S5Q

<u>Rank Justification</u>: This provisional association occurs within a wide geographic range with relatively narrow environmental conditions. Known sites are in protected areas.

Ledum groenlanicum-Kalmia microphylla/Sphagnum spp. Shrubland

Bog-laurel/Sphagnum Shrubland

Acronym: LEDGRO-KALMIC/SPHAGN
NatureServe Code: CEGL003414
Macrogroup: North Pacific Bog & Fen

Group: North Pacific Lowland Bog & Poor Fen

Alliance: Ledum groenlandicum-Kalmia microphylla Shrubland

Classification Confidence Level: 1

Range: This association occurs on the Olympic Peninisula and the northern Puget

Lowland.

Plots: 1, MORA (0), NOCA (0), OLYM (1), Other (0)

Environmental Description: This association occurs at low elevations in depressions, on slopes, surrounding lakes or ponds, or associated with flat floodplains. Water tables are often at or near the surface for much of the growing season, and organic decomposition is slow. The substrate is moderately quaking to firm peat mats. Well-developed hummocks are common.

<u>Vegetation Description</u>: Ledum groenlandicum and/or Kalmia microphylla form a dense, short shrub layer. Other dwarf-shrubs frequently present are *Vaccinium oxycoccus* and *Gaultheria shallon*. A variety of herbaceous species may occur, the most frequent are usually *Drosera rotundifolia* and *Potentilla palustris*. Sphagnum spp. are the dominant feature in the spaces among vascular plants.

USFWS Wetland System: Palustrine.

Comments:

Conservation Rank: S3

Rank Justification: This bog/poor fen association occurs within a narrow ecological range with sites occurring on protected lands. Sites off protected areas are often threatened by hydrologic changes created by various land uses.

Synonyms:

Kalmia occidentalis-Ledum groenlandicum-Vaccinium oxycoccus/Sphagnum spp. variant, Kunze 1994

Kalmia occidentalis/Sphagnum spp. variant, Kunze 1994

Kalmia occidentalis-Ledum groenlandicum-Gaultheria shallon/Pteridium aquilinum/Sphagnum spp. variant, Kunze 1994

Ledum groenlandicum-Kalmia microphylla/Sphagnum spp. Shrubland; Chappell 2005

Pinus contorta var. contorta/Ledum groenlandicum/Sphagnum spp. Woodland

Shore Pine/Bog Labrador-tea/Sphagnum spp. Woodland

<u>Acronym</u>: PINCON/LEDGRO/SPHAGN

<u>NatureServe Code</u>: CEGL003337 <u>Macrogroup</u>: North Pacific Bog & Fen

Group: North Pacific Lowland Bog & Poor Fen

Alliance: Pinus contorta var. contorta-Sphagnum spp. Woodland

Classification Confidence Level: 2

Range: This association occurs at low elevations in western Washington and may

occur in the national parks, most likely being Olympic National Park.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: Sites are bogs or poor fens with saturated peat soils and acidic, nutrient-poor conditions. Topography is typically flat basins or

depressions.

Vegetation Description: The open woodland tree canopy is dominated by Pinus

contorta var. contorta. Tsuga heterophylla or Thuja plicata may also occur in smaller amounts. The well-developed shrub layer is dominated by Ledum groenlandicum, or co-dominated by that species and Gaultheria shallon or Kalmia microphylla (=occidentalis). The herb layer can be sparse to moderately dense and often has abundant Pteridium aquilinum. A well-developed moss layer is often dominated by Sphagnum spp. that is always at least present.

USFWS Wetland System: Palustrine.

<u>Comments</u>: This association is not represented in the current dataset of vegetation plots for national parks in Washington. The distinction between *Pinus contorta* varieties *contorta* and *latifolia* is rarely determined in field data. We assume that all *Pinus contorta* at low elevation (under 1970ft, 600 m) west of the Cascades is variety *contorta*.

Conservation Rank: S2

<u>Rank Justification</u>: This association is represented by few occurrences and only occurs within a limited geographic range. <u>Synonyms</u>:

Pinus contorta var. contorta/Ledum groenlandicum/Sphagnum spp. Woodland; Chappell 2005 Pinus contorta/Ledum groenlandicum/Sphagnum spp. community type; Kunze 1994, p19,75

Thuja plicata-Tsuga heterophylla/Lysichiton americanus/Sphagnum spp. Woodland

Western Redcedar-Western Hemlock/Skunkcabbage/Sphagnum Spp.

Acronym: THUPLI-TSUHET/LYSAME/SPHAGN

<u>NatureServe Code</u>: CEGL001787 <u>Macrogroup</u>: North Pacific Bog & Fen

Group: North Pacific Lowland Bog & Poor Fen

Alliance: Tsuga heterophylla-(Thuja plicata)-Sphagnum

spp. Woodland

Classification Confidence Level: 3

<u>Range</u>: This association occurs on the western coastal plain of the Olympic Peninsula.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This wooded wetland occurs in poor fens or bogs. Topographic setting can be basins or gentle slopes. Soils are generally saturated and composed of a mixture of fibrous *Sphagnum*, heath, and woody peat.

<u>Vegetation Description</u>: The open, relatively stunted tree canopy is dominated by *Thuja plicata* and *Tsuga heterophylla*. *Picea sitchensis* is also frequent. The shrub layer, rooted on woody debris, is dominated by *Gaultheria shallon*, with frequent *Menziesia ferruginea*, *Frangula (Rhamnus) purshiana*, and *Vaccinium alaskaense*. The well-developed herb layer is characterized by abundant *Lysichiton americanus* and *Blechnum spicant*. *Carex* spp. are often present to sometimes codominant. *Sphagnum* spp. usually dominate the moss layer and cover at least 15 % of the ground.

USFWS Wetland System: Palustrine.

<u>Comments</u>: This association is distinguished from *Tsuga heterophylla-Thuja plicatal Gaultheria shallon/Lysichiton americanus* Forest (CEGL003226), by the open, stunted tree canopy, abundance of *Sphagnum* spp., usually much more diverse herbaceous layer, and fibric peat soils. This association is not represented in the current dataset of vegetation plots for national parks in Washington. There is one known example of a coastal (Olympic NP) occurrence of *Thuja plicata-Tsuga heterophylla/Gaultheria shallon/Lysichiton americanus* forest association recorded by the Washington Natural Heritage Program.

Conservation Rank: S1S2

Rank Justification: This association occurs only in bogs or poor fens. It is sensitive to changes in hydrology or water quality and to logging disturbance.

Synonyms:

Thuja plicata-Tsuga heterophylla/Gaultheria shallon/Lysichitum americanum/Sphagnum spp. community type; Kunze 1994 Thuja plicata-Tsuga heterophylla/Lysichiton americanus/Sphagnum spp. Woodland; Chappell 2005

Kalmia microphylla-Carex nigricans Dwarf-shrubland

Bog-laurel/Black Alpine Sedge Dwarf-shrubland

Acronym: KALMIC-CARNIG
NatureServe Code: CEGL001402
Macrogroup: North Pacific Bog & Fen
Group: North Pacific Montane Rich Fen
Alliance: Kalmia microphylla Dwarf-shrubland

Classification Confidence Level: 1

Range: This association occurs at Mount Rainier and elsewhere in the Cascades.

Plots: 11, MORA (10), NOCA (0), OLYM (0), Other (1)

Environmental Description: This association occurs in the subalpine parkland in moist subalpine and alpine meadows, snowbeds, lake margins, and other low-gradient depressions. Sites are flat or gently sloping, have poorly drained soils, and are often adjacent to streams or lakes. These habitats are cold with late melting snowfields. Water tables are often at or near the surface for much of the growing season, organic decomposition is slow and soils are organic.

Photo Not Available

<u>Vegetation Description</u>: Kalmia microphylla appears consistently as the dominant dwarf-shrub but usually has less than 25% total cover. Other dwarf-shrubs frequently present to co-dominant are *Vaccinium deliciosum* and *Phyllodoce empetriformis*. A variety of herbaceous species may occur, the most abundant of which are usually *Oreostemma (Aster) alpigenum, Carex nigricans* and *Carex spectabilis*. Other important herbs include *Caltha leptosepala (=biflora, leptosepala)*, *Erigeron peregrinus*, and *Potentilla flabellifolia*.

USFWS Wetland System: Palustrine.

Comments: Dwarf-shrub cover is always present but typically less than 25% in this herbaceous-dominated community.

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs within a narrow range of environments with few threats on protected land. Climate change will likely affect this vegetation.

Synonyms:

Carex/Kalmia Community Type; Henderson 1974
Kalmia microphylla/Carex nigricans; Wooten and Morrison 1995
Kalmia microphylla-Carex nigricans Herbaceous Vegetation-name change; Chappell 2005

Tsuga mertensiana-Abies amabilis/Caltha leptosepala Woodland

Mountain Hemlock-Pacific Silver Fir/Two-flowered Marsh Marigold Woodland

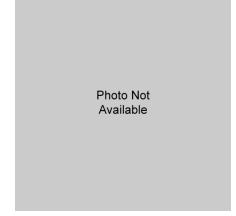

Acronym: TSUMER-ABIAMA/CALLEP
NatureServe Code: CEGL000501
Macrogroup: North Pacific Bog & Fen
Group: North Pacific Montane Rich Fen
Alliance: Tsuga mertensiana Treed Fen
Classification Confidence Level: 2

Range: This association occurs in the North Cascades and possibly wetter parts of

the Olympics.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This wooded wetland association occurs near the upper limits of continuous forest between the elevations of 760-1530 m (2500 to 5000 ft). It appears on very moist to wet, poorly-drained, concave sites. It is typically associated with springs or seeps and usually occurs as linear stringers. Soils are saturated year-round.

<u>Vegetation Description</u>: Tsuga mertensiana and Abies amabilis co-dominate the rather short tree canopy. Cupressus (=Chamaecyparis) nootkatensis is also sometimes prominent. The patchy shrub layer is usually dominated by Vaccinium alaskaense, and often co-dominated by Vaccinium membranaceum and/or Menziesia ferruginea. The shrubs are typically clumped near the bases of trees. A relatively lush, forb-dominated herb layer always has a least 10% cover of Caltha leptosepala (=biflora, leptosepala). Several other herbaceous species can be prominent, especially Rubus pedatus, Streptopus lanceolatus (=roseus) var. curvipes, Athyrium filix-femina, Veratrum viride, Lysichiton americanus, and Valeriana sitchensis. Sphagnum spp. are documented as abundant in British Columbia and probably also occur in Washington.

USFWS Wetland System: Palustrine.

<u>Comments</u>: The association name differs from NatureServe which uses *Caltha leptosepala* ssp. *howellii*. This association is not represented in the current dataset of vegetation plots for national parks in Washington although a OLYM legacy plot from Olympic National Park is associated with a seep and has scattered, short *Cupressus nootkatensis* with a herbaceous layer of *Saxifraga nelsonii* and *Caltha leptosepala*. It likely represents an early seral -stage of this association. It appears as CUPNOO-TSUMER/CALLEP in Appendix C.

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs in small patches associated with a wetland environment. It is moderately threatened by logging and associated impacts and is fragile because of its saturated, organic soils

<u>Synonyms</u>:

Carex mertensii Herbaceous Vegetation

Mertens' Sedge Herbaceous Vegetation

Acronym: CARMER

NatureServe Code: Provisional

Macrogroup: Western North America Wet Meadow & Low Shrub Carr

Group: Temperate Pacific Subalpine-Montane Wet Meadow

Alliance: Carex (spp.) Herbaceous Vegetation

Classification Confidence Level: 3

Range: This occurs in the Olympic and possibly in the Cascade Mountains.

Plots: 2, MORA (0), NOCA (0), OLYM (2), Other (0)

Environmental Description: This association was sampled between 1250-3000 m (4100-4300 ft) elevation on sites with 5-15% slope. Both sites are subject to periodic disturbance, one by avalanche run-out and the other by flooding.

<u>Vegetation Description</u>: This dense and floristically diverse herbaceous association is dominated by *Carex mertensii*. *Polygonum bistortoides*, *Lupinus*

(arcticus ssp. subalpinus, latifolius), Potentilla flabellifolia, and Phleum alpinum occurred in both plots. Agrostis oregonensis, Juncus drummondii, Carex nigricans, and Veratrum viride occur with 10-20% cover.

USFWS Wetland System: Palustrine.

<u>Comments</u>: These legacy plots might represent variation in *Carex nigricans* (CEGL001816) and *Valeriana sitchensis-Veratrum viride* (CEGL001998) associations.

Conservation Rank: S3S4Q

<u>Rank Justification</u>: This provisional association occurs within a limited geographic range and environment. Known sites are in protected areas.

Carex nigricans Herbaceous Vegetation

Black Alpine Sedge Herbaceous Vegetation

Acronym: CARNIG

NatureServe Code: CEGL001816

Macrogroup: Western North America Wet Meadow & Low

shrub carr

Group: Temperate Pacific Subalpine-Montane Wet Meadow

Alliance: Carex (spp.) Herbaceous Vegetation

Classification Confidence Level: 1

Range: This association occurs in the Olympic and

Cascade Mountains.

<u>Plots</u>: 40, MORA (12), NOCA (0), OLYM (18), Other (10) <u>Environmental Description</u>: This wet meadow occurs in the subalpine parkland and lower alpine zones. Sites occupied are flats, depressions, or gentle slopes with late snow-melt and poorly drained, seasonally wet soils. Bare ground is frequently present.

<u>Vegetation Description</u>: The vegetation is dominated by

relatively dense *Carex nigricans*. Several other species may occur prominently, especially *Luetkea pectinata*, *Carex spectabilis and Juncus drummondii*. Other comon hrebaceous species include *Erythronium montanum*, *Poa fendleriana*, or *Carex illota*. Dwarf-shrubs *Phyllodoce empetriformis*, *Vaccinium deliciosum* and *Cassiope mertensiana* are frequently present but contribute less than 10% cover. Trees are absent and shrubs are confined to hummocks.

<u>Comments</u>: This association merges both the *Carex nigricans - Erythronium montanum* Herbaceous (CEGL001817) and the *Carex nigricans - Luetkea pectinata* Herbaceous (CEGL001819) associations into a single, coastal Pacific Northwest association. Co-dominance by *Caltha leptosepala* (=*biflora, leptosepala*) indicates the *Carex (aquatilis* var. *dives, nigricans) - Caltha leptosepala* ssp. *howellii* association (Henderson 1974) that tends to be wetter and occur at lower elevations (see Appendix B).

Conservation Rank: S4

Range: This association occurs at Mount Rainier National

Park and in the Olympic Mountains.

Plots: 34, MORA (7), NOCA (0), OLYM (15), Other (12)

<u>Environmental Description</u>: This subalpine meadow occurs in moist basins between 1250 -2100 m (4110-6895

ft) elevation. Sites are typically flat to concave.

<u>Vegetation Description</u>: The vegetation is dominated by <u>Carex spectabilis</u> with <u>Carex nigricans</u> and/or <u>Potentilla</u> <u>flabellifolia</u> usually prominent to co-dominant. This is a

species-rich association, however few species other than the dominants are rarely more than prominent. *Caltha leptosepala* (=biflora, leptosepala) and *Juncus drummondii* appear occasionally as prominent.

USFWS Wetland System: Not applicable.

Comments: This is a name change of the Carex spectabilis-Potentilla flabellifolia association (CEGL001829).

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs within a limited geographic range and environment. Known sites are in protected areas. Climate change will likely affect this vegetation.

Synonyms:

Purshia tridentata/Pseudoroegneria spicata Shrubland

Bitterbrush/Bluebunch Wheatgrass Shrubland

Acronym: PURTRI/PSESPI

NatureServe Code: CEGL001495

Macrogroup: Northern Great Basin Shrub Steppe & Grassland

Group: Inter-Mountain Basins Big Sagebrush Steppe

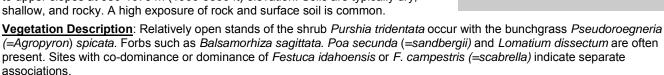

Alliance: Artemisia vaseyana-Purshia tridentata Shrubland

Classification Confidence Level: 1

Range: This association occurs in the Lake Chelan National Recreational Area and, more generally, in the eastern Cascades in Washington and Oregon, the Blue Mountains, and the Bitterroot Valley in Montana.

Plots: 0, MORA (0), NOCA (0), OLYM (0), Other (0)

Environmental Description: This association occurs on steep, south facing, mid to upper slopes at 580-1675 m (1900-5500 ft) elevation. Soils are typically dry, shallow, and rocky. A high exposure of rock and surface soil is common.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is not represented in the current data for national parks in Washington. However, it may occur near Lake Chelan.

Conservation Rank: S2

<u>Rank Justification</u>: This relatively widespread association is known from the eastern Cascades into British Columbia, the Blue Mountains, and Bitterroot Valley in Montana. Very few high condition (i.e. having few exotic species), representative stands are known. Occurrences are declining due to exotic annual grass species and the loss of stands to fire disturbance events.

Arctostaphylos uva-ursi-(Dasiphora fruticosa) Dwarf-shrubland

Kinnikinnick-(Shrubby Cinquefoil) Dwarf-shrubland

<u>Acronym</u>: ARCUVA-(DASFLO) <u>NatureServe Code</u>: CEGL001392

Macrogroup: Vancouverian Alpine-Subalpine Dwarf Shrub,

Forb Meadow & Grassland

Group: North Pacific Alpine-Subalpine Dwarf-shrubland and

Heath

Alliance: Dasiphora fruticosa Dwarf-shrubland

Classification Confidence Level: 2

Range: This association occurs at Mount Rainier and in the

North Cascades.

Plots: 8, MORA (8), NOCA (0), OLYM (0), Other (0)

Environmental Description: This association occurs at high elevations (1800-2225 m (5900-7300 ft)) on southerly aspects with dry soils in the alpine or upper subalpine parkland zones.

Vegetation Description: Arctostaphylos uva-ursi dominates

or co-dominates with Dasiphora fruticosa ssp. floribunda (=Potentilla fruticosa). Juniperus communis or Empetrum nigrum can be occasionally prominent to co-dominant dwarf-shrubs. Carex nigricans and Artemisia furcata can be prominent. Many herbaceous species typical of high elevations can occur, such as Festuca brachyphylla (=ovina var. rydbergii), Lupinus sellulus var. lobbii (=lepidus var. lobbii), Minuartia (=Arenaria) obtusiloba, Minuartia rubella, Penstemon procerus, and Solidago simplex var. nana (=spathulata).

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is called *Arctostaphylos uva-ursi* in the NVC. This association is similar to Rocky Mountain *Arctostaphylos uva-ursi*/Solidago multiradiata (CEGL005832) however, it lacks the graminoid component of *Calamagrostis koelerioides*, *Festuca idahoensis*, *F. campestris* and other typical Rocky Mountain elements. Two plots with prominent *Empetrum nigrum* probably represent a transition to the *Empetrum nigrum-Lupinus sellulus* association.

Conservation Rank: S3

Rank Justification: This association occurs within a limited geographic and ecological range but faces few threats.

Synonyms:

Arctostaphylos uva-ursi Community; Douglas and Bliss 1977 Arctostaphylos uva-ursi Solidago spathulata Association; Hamann 1972 Arctostaphylos uva-ursi-Festuca brachyphylla Dwarf-shrubland; Chappell 2005

Classification Confidence Level: 2

Range: This association occurs on the slopes of Mount Rainier and elsewhere in the Cascade Mountains.

Plots: 13, MORA (13), NOCA (0), OLYM (0), Other (0)

<u>Environmental Description</u>: This association occurs above upper treeline (alpine zone). Sites occupied are well-drained slopes (north aspect at Mount Rainier and on south to west aspects in North Cascades).

<u>Vegetation Description</u>: The dwarf-shrub *Empetrum nigrum* dominates the vegetation, which typically covers approximately half of the ground surface. Other dwarf-shrubs such as *Phyllodoce glandulifera* or *Salix nivalis* maybe present. *Lupinus* sellulus var. lobbii (=lepidus var. lobbii) is usually present to prominent at Mount Rainier but is less prominent in the North Cascades. The forbs *Erigeron aureus*, *Oreostemma alpigenum*, and *Pedicularis contorta* are frequent at Mount Rainier. *Salix cascadensis* and *Vaccinium caespitosum* are associated short shrubs in the North Cascades.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S3

Rank Justification: This association occurs on protected land within a restricted range of environments with few threats.

<u>Acronym</u>: CASMER-PHYEMP <u>NatureServe Code</u>: CEGL001398

Macrogroup: Vancouverian Alpine-Subalpine Dwarf Shrub,

Forb Meadow & Grassland

Group: North Pacific Alpine-Subalpine Dwarf-shrubland and

Heath

Alliance: Phyllodoce empetriformis-Cassiope mertensiana-

(Vaccinium deliciosum) Dwarf Shrubland

Classification Confidence Level: 2

Range: This association occurs in the Olympic and Cascade

Mountains.

Plots: 65, MORA (18), NOCA (4), OLYM (37), Other (6)

<u>Environmental Description</u>: This association occurs at or above treeline, usually in the lower portion of the alpine zone. Sites have well-drained mesic soils, and can be rocky.

<u>Vegetation Description</u>: The vegetation is dominated by

Cassiope mertensiana and/or Phyllodoce empetriformis. Both are typically present and more often prominent. Tree species are usually absent. Other relatively abundant species (sometimes prominent) include Luetkea pectinata, Vaccinium deliciosum, Carex spectabilis, Pedicularis ornithorhyncha, and Antennaria lanata.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This type is distinguished from the similar, but more subalpine parkland type, *Phyllodoce empetriformis-Vaccinium deliciosum-(Cassiope mertensiana)* (CEGL001407), by the alpine setting, presence of alpine species like *Phyllodoce glanduliflora*, and the lower mean abundance and height of *Vaccinium deliciosum*. These could be combined into a generalized heather type encompassing alpine and subalpine sub-associations.

Conservation Rank: S3S4

<u>Rank Justification</u>: This association occurs within a limited geographic range and environment. Known sites are in protected areas. Climate change will likely affect this vegetation.

Synonyms:

Phyllodoce empetriformis-Vaccinium deliciosum-(Cassiope mertensiana) Subalpine Dwarf-shrubland

Pink Mountain-heather-Blueleaf Huckleberry-(White Mountain Heather) Dwarf-shrubland

Acronym: PHYEMP-VACDEL-(CASMER)

NatureServe Code: CEGL001407

Macrogroup: Vancouverian Alpine-Subalpine Dwarf Shrub, Forb Meadow &

Grassland

Group: North Pacific Alpine-Subalpine Dwarf-shrubland and Heath

Alliance: Phyllodoce empetriformis-Cassiope mertensiana-(Vaccinium

deliciosum) Dwarf Shrubland

Classification Confidence Level: 1

Range: This association occurs in the Olympic and Cascade Mountains.

Plots: 102, MORA (11), NOCA (0), OLYM (65), Other (26)

<u>Environmental Description</u>: This association is the most common subalpine meadow type in the moist to wet climatic areas (areas not greatly affected by rainshadows). It is generally found on gentle to moderate slopes with well-drained soils although it has been observed on steep slopes as well.

<u>Vegetation Description</u>: The relatively dense dwarf-shrub vegetation is almost always co-dominated by *Phyllodoce empetriformis* and *Vaccinium deliciosum*. *Cassiope mertensiana* can be prominent but rarely co-dominates. Numerous other species can be present although rarely in abundance. *Luetkea pectinata, Polygonum bistortoides,* and *Carex spectabilis* are most frequently present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: The subalpine setting, greater abundance of *Vaccinium deliciosum*, and lack of alpine associated species distinguishes this association from the *Cassiope mertensiana-Phyllodoce empetriformis* Alpine Dwarf-shrubland (CEGL001398). The two could be combined into a generalized heather type encompassing alpine and subalpine subassociations. This association may appear as a sparsely vegetated lithomorphic type on steep, more rocky sites where *Phyllodoce empetriformis* and *Cassiope mertensiana* are the most abundant vascular plants (PHYEMP-CASMER lithomorphic in table).

Conservation Rank: S3

<u>Rank Justification</u>: This association is very common in subalpine settings, is represented on protected areas and has few threats. Climate change will likely affect this vegetation.

Grassland

Group: North Pacific Alpine-Subalpine Dwarf-shrubland and Heath

Alliance: Phyllodoce empetriformis-Cassiope mertensiana-(Vaccinium

deliciosum) Dwarf Shrubland

Classification Confidence Level: 3

Range: This association is described from the North Cascades, and may

occur elsewhere in the Cascade or Olympic Mountains.

<u>Plots</u>: 4, MORA (0), NOCA (4), OLYM (0), Other (0)

Environmental Description: This association occurs at relatively high elevations of 1370-1675 m (4500-5500 ft). Sites are on moderately steep to steep slopes near debris avalanches, on old talus and on valley or cirque walls. Rock can be abundant when associated with open meadows in the *Tsuga mertensiana* parkland.

<u>Vegetation Description</u>: The vegetation is co-dominated by taller *Sorbus sitchensis* and shorter *Vaccinium deliciosum* and *Phyllodoce empetriformis* shrubs. Other shrubs, particularly *Vaccinium membranaceum*, and forbs *Carex spectabilis*, *Mitella breweri*, *Polygonum bistortoides* and *Veratrum viride* are frequently occurring associates. The forb layer is diverse but usually low in percent cover.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This type is transitional with the broadly defined *Phyllodoce empetriformis-Vaccinium deliciosum-(Cassiope mertensiana)* association (CEGL001407) and various high elevation avalanche/debris chute communities.

Conservation Rank: S3S4

Rank Justification: This provisional association occurs within a narrow environmental range on sites that have few threats.

Group: North Pacific Alpine-Subalpine Dwarf-shrubland and

Alliance: Vaccinium (deliciosum, membranaceum) Dwarf

Shrubland

Classification Confidence Level: 1

Range: This association occurs in the Cascade and Olympic

Mountains.

Plots: 52, MORA (7), NOCA (1), OLYM (39), Other (5)

Environmental Description: This association occurs in subalpine parklands and may extend up into the lower alpine. Sites have well-drained soils and occur on gentle to moderate slopes.

Vegetation Description: The vegetation is dominated by *Vaccinium deliciosum*. *Phyllodoce empetriformis* and *Cassiope* mertensiana, when present, have less than 10% cover. Associated species are variable. Frequently occurring species include Polygonum bistortoides, Lupinus (arcticus ssp. subalpinus, latifolius), Hieracium gracile, Carex spectabilis, Veronica cusickii, and Valeriana sitchensis.

USFWS Wetland System: Not applicable.

Comments: Xerophyllum tenax dominates the herbaceous layer in two Olympic plots and one Mount Rainier plot and may represent a subassociation. Alpine and subalpine subassociations could also be recognized within this association concept. This association may appear as a sparsely vegetated lithomorphic type on steep, rocky sites where Vaccinium deliciosum is the most abundant vascular plant.

Conservation Rank: S3S4

Rank Justification: This association occurs throughout the high elevations of the Cascades and Olympics in Washington. Climate change will likely affect this vegetation.

Range: This association occurs in the Olympic and Cascade Mountains in

Washington and in the Rocky Mountains.

Plots: 2, MORA (1), NOCA (0), OLYM (1), Other (0)

Environmental Description: This association occurs in the upper subalpine parkland and alpine zones. Sites have well-drained soils, although in the eastern Cascades it can also be found on wetland edges in broad valleys.

<u>Vegetation Description</u>: This sparse to open vegetation is dominated by *Festuca brachyphylla (=ovina* var. *rydbergii)* in the Cascades or *F. saximontana* (=ovina var. brevifolia) in the Olympic Mountains. *Arenaria capillaris*, *Danthonia intermedia* or *Erigeron peregrinus* are usually present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Both plots are legacy and list *Festuca ovina* as community dominant. Recent taxonomic treatment splits this taxon into *Festuca brachyphylla* (primarily Cascades) and *Festuca saximontana* (primarily Olympics). These two species are treated as ecologic equivalents for this classification. This association is provisionally included in the *Festuca brachyphylla* herbaceous vegetation (CEGL001797) currently recognized in the central Rockies.

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs in narrow range of environments with few threats on protected land. Climate change will likely affect this vegetation.

Festuca roemeri-(Phlox diffusa-Arenaria capillaris) Herbaceous Vegetation

Roemer's fescue-(Spreading Phlox-Slender Mountain Sandwort) Herbaceous Vegetation

Acronym: FESROE-(PHLDIF-ARECAP)

NatureServe Code: Preliminary

Macrogroup: Vancouverian Alpine-Subalpine Dwarf Shrub,

Forb Meadow & Grassland

Group: North Pacific Alpine Herbaceous Meadow

Alliance: Festuca (brachyphylla, roemeri, saximontana)

Meadow

Classification Confidence Level: 1

Range: This grassland association occurs in the

northeastern Olympic Mountains.

Plots: 52, MORA (0), NOCA (0), OLYM (52), Other (0)

Environmental Description: This grassland occurs at high elevations as meadows in the upper subalpine parkland and in the alpine zone. Sites are typically on mesic, moderate slopes with relatively warm south to west exposures. Soils are acidic, relatively deep, poorly developed sandy loams that can be rocky.

<u>Vegetation Description</u>: This association is a moderately dense to dense, mixed graminoid and forb herbaceous layer that is less than 0.5 m (1.5 ft) tall. It is dominated or co-dominated by *Festuca roemeri* (=idahoensis). *Phlox diffusa* ssp. *longistylis* is typically prominent to co-dominant. Other frequent species include *Arenaria capillaris*, *Achillea millefolium*, *Antennaria microphylla*, *Campanula rotundifolia*, *Carex phaeocephala*, *Polygonum bistortoides*, and *Silene parryi*. *Lupinus (arcticus ssp. subalpinus, latifolius)* and *Hydrophyllum fendleri* occasionally occur prominently. Dry sites commonly include *Lomatium martindalei*, *Eriophyllum lanatum*, and *Lathyrus nevadensis*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association expands the concept of *Festuca roemeri - Phlox diffusa* ssp. *longistylis* Herbaceous (CEGL001622) by merging it with the *Festuca roemeri-Delphinium glareosum* (CEGL001613) association.

Conservation Rank: S2

Rank Justification: This community is naturally globally rare, with few occurrences (certainly less than 50, quite possibly less than 20) covering a relatively small area. This association's range is extremely restricted within a small rainshadow zone of the northeastern Olympic Mountains, where it occurs near and above treeline and is locally frequent. Stands are slightly threatened from recreational impacts and moderately threatened, in the long-term, from treeline changes associated with global climate change.

Synonyms:

Festuca roemeri-Phlox diffusa ssp. longistylis; Chappell 2005

"Subalpine" Sites; Belsky and del Moral 1982 Mesic Grass Type; Kuramoto and Bliss 1970

Phlox diffusa-Lupinus sellulus var. lobbii-(Pedicularis contorta) Herbaceous Vegetation

Spreading Phlox-Donner Lake Lupine-(Slender Mountain Sandwort) Herbaceous Vegetation

Acronym: PHLDIF-LUPSEL-(PEDCON)

NatureServe Code: Preliminary

Macrogroup: Vancouverian Alpine-Subalpine Dwarf Shrub, Forb Meadow &

Grassland

Group: North Pacific Alpine Herbaceous Meadow

Alliance: Festuca (brachyphylla, roemeri, saximontana) Meadow

Classification Confidence Level: 3

Range: This association occurs in the Cascade and Olympic Mountains.

Plots: 15, MORA (14), NOCA (0), OLYM (1), Other (0)

<u>Environmental Description</u>: This association typically occupies sites above treeline (alpine zone). Sites are often rocky but can occur on flat to moderately steep slopes.

Vegetation Description: This open to sparsely developed herbaceous vegetation

features *Phlox diffusa* as the most abundant species, typically with *Lupinus sellulus* var. *lobbii* (=lepidus var. *lobbii*) as prominent to co-dominant. *Arenaria capillaris*, *Carex spectabilis*, *Erysimum arenicola*, *Achillea millifolium*, *Oreostemma alpigenum*, *Solidago multiradiata*, *Trisetum spicatum*, *Penstemon procerus*, and *Pedicularis contorta* are other commonly occuring species.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S3

<u>Rank Justification</u>: This preliminary association occurs at few sites, is represented on protected areas and has few threats. Climate change will likely affect this vegetation.

Synonyms:

Phlox diffusa-(Lupinus sellulus var. lobbii-Arenaria capillaris) Herbaceous Vegetation; Chappell 2005 Phlox diffusa-Arenaria capillaris Association; Hamann 1972

Phlox diffusa-Eriogonum pyrolifolium Community; del Moral 1979

Selaginella wallacei-Festuca (roemeri, saximontana, brachyphylla) Herbaceous Vegetation

Wallace's Spike-moss-Roemer's or Rocky Mountain Fescue Herbaceous Vegetation

Acronym: SELWAL-(FESROE, FESBRA)

NatureServe Code: Preliminary

Macrogroup: Vancouverian Alpine-Subalpine Dwarf Shrub,

Forb Meadow & Grassland

Group: North Pacific Alpine Herbaceous Meadow

Alliance: Festuca (brachyphylla, roemeri, saximontana)

Meadow

Classification Confidence Level: 3

Range: This association occurs in the Olympic Mountains

and at Mount Rainier National Park.

Plots: 10, MORA (1), NOCA (0), OLYM (9), Other (0)

Environmental Description: This association is found in dry balds within forest landscapes at middle elevations. The type can also be found on sites with exposed bedrock in the upper subalpine and alpine zones.

Vegetation Description: The sparsely developed

herbaceous layer has the moss-like *Selaginella wallacei* as the most abundant species (average cover 24%). *Festuca roemeri* (=idahoensis) and *Festuca brachyphylla* (=ovina var. rydbergii) in the Cascades or *F. saximontana* (=ovina var. brevifolia) in the Olympic Mountains occurs on most sites, however cover is low (less than 5%). Sites with *Geum triflorum*, *Phlox diffusa*, *Erigeron compositus*, *Dasiphora fruticosa ssp. floribunda* (=Potentilla fruticosa), and *Carex phaeocephala* present are indicative of upper subalpine and alpine environments in the Olympics.

<u>Comments</u>: Selaginella wallacei can be abundant in many of the low to mid elevation bald associations described by Chappell (2006) and as such, the mid-montane portions of this association may be early successional sites related to one of several associations dominated by graminoid and forb species. Similar vegetation at lower elevations in British Columbia is described as the *Racomitrium spp.-Selaginella wallacei* bryophyte association that is typically is dominated by mosses with *Selaginella wallacei* prominent to co-dominant and with a more diverse assortment of grasses. This latter association occurs in Washington, but it has not been quantitatively described.

Conservation Rank: S3Q

<u>Rank Justification</u>: This preliminary association occurs within a narrow environmental range on sites that have few threats. Recreational use of sites would decrease their condition.

Acer circinatum-(Holodiscus discolor) Lithomorphic Vegetation

Vine Maple-(Oceanspray) Lithomorphic Vegetation

Acronym: ACECIR-(HOLDIS) Lithomorphic

NatureServe Code: Provisional

Macrogroup: Vancouverian Cliff, Scree & Other Rock

Vegetation

Group: North Pacific Montane Massive Bedrock, Cliff and

Talus

Alliance: Acer circinatum-(Holodiscus discolor)

Lithomorphic Vegetation

Classification Confidence Level: 3

Range: This association occurs in the Olympic and Cascade

Mountains.

Plots: 4, MORA (2), NOCA (0), OLYM (2), Other (0)

Environmental Description: This association occurs at middle elevations (1030-1400 m (3400-4600 ft)) on steep slopes (40-100%). Exposed rock, including bedrock, dry talus, scree and rock slides, are a common feature of this type.

<u>Vegetation Description</u>: This is an open community (6-55% total cover) with *Acer circinatum* and *Holodiscus discolor* each contributing 5-10% cover. Other shrubs may include *Acer glabrum* and *Rosa gymncarpium*. The fern *Cryptogramma acrostichoides* (=crispa) occurs frequently. Mosses and lichens often dominate the ground cover.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This is similar to the preliminary *Acer circinatum* shrubland association. However, this lithomorhpic association is found on much drier, more harsh sites.

Conservation Rank: S2S4Q

Rank Justification: This association has a provisional classification status and is represented at few sites on protected areas.

Campanula piperi Lithomorphic Vegetation

Olympic Bellflower Lithomorphic Vegetation

<u>Acronym</u>: CAMPIP Lithomorphic <u>NatureServe Code</u>: Preliminary

Macrogroup: Vancouverian Alpine Cliff, Scree & Other Rock Vegetation

Group: North Pacific Alpine and Subalpine Bedrock and Scree

Alliance: Campanula piperi Lithomorphic Vegetation

Classification Confidence Level: 3

Range: This association occurs only in the Olympic Mountains.

Plots: 6, MORA (0), NOCA (0), OLYM (6), Other (0)

Environmental Description: This association appears at elevations between 1460 and 1950 m (4820-6400 ft). It mostly occurs on easterly aspects and moderately steep slopes. Exposed bedrock, with little moss or lichen cover, is common.

<u>Vegetation Description</u>: Campanula piperi, averaging 5% cover, is the most common species in this sparsely vegetated, lithomorphic association. Viola flettii and Paxistima (=Pachistima) myrsinites occurred in half the plots.

USFWS Wetland System: Not applicable.

<u>Comments</u>: All plots are legacy plots that represent rare plant (*Campanula piperi*) habitat in the sample data and are included in the *Astragalus* community of Schreiner (1994).

Conservation Rank: S2S4

Rank Justification: This preliminary association is restricted to the Olympic Mountains and appears in a narrow environment. Most sites are in protected areas.

Athyrium americanum-Cryptogramma acrostichoides Lithomorphic Vegetation

Alpine Ladyfern-American Rockbrake Lithomorphic Vegetation

<u>Acronym</u>: ATHAME-CRYACR <u>NatureServe Code</u>: CEGL005900

Macrogroup: Vancouverian Cliff, Scree & Other Rock

Vegetation

Group: North Pacific Montane Massive Bedrock, Cliff and

l alus

<u>Alliance</u>: Carex spectabilis – Dwarf shrub Lithomorphic

Vegetation

Classification Confidence Level: 2

Range: This preliminary type occurs in the Olympic and Cascades Mountains.

Plots: 3, MORA (0), NOCA (1), OLYM (3), Other (0)

Environmental Description: This type occurs at midmontane elevations on moist talus with steep (30-60%)

slopes.

Vegetation Description: This fern community is dominated

by Athyrium americanum with Cryptogramma acrostichoides (=crispa) typically present. Cover is generally sparse but can be up to 70%. Anaphalis margaritacea, Elmera racemosa. Eucephalus (=Aster) paucicapitatus, Juncus parryi, Luetkea pectinata, and Spiraea splendens (=densiflora) are common, low cover associates. Mosses are usually present but rarely abundant.

<u>Comments</u>: This association appears to be the same as the *Athyrium americanum* - *Cryptogramma acrostichoides*Lithomorphic Vegetation (CEGL005900) found in Montana although both may be part of the more broadly defined *Athyrium americanum* association recognized in Colorado (CEGL001849). This Pacific Northwest association varies from the Rocky Mountain types in the presence of endemics such as *Eucephalus* (=*Aster*) paucicapitatus and *Elmera racemosa*. One Olympic legacy sample (ELMPAC in synthesis tables), which features a dense herbaceous vegetation dominated by *Elmera racemosa* and *Athrium americanum*, could either represent a variant of the *Athyrium americanum-Cryptogramma acrostichoides* Lithomorphic association or represent the preliminary *Elmera racemosa-(Senecio neowebsteri*) Lithomorphic association.

Conservation Rank: S2S4

<u>Rank Justification</u>: This preliminary association is narrowly restricted ecologically apparently over a wide geographic range. It, however, has few threats.

Carex spectabilis Lithomorphic Vegetation

Showy Sedge Lithomorphic Vegetation

<u>Acronym</u>: CARSPE Lithomorphic NatureServe Code: Preliminary

Macrogroup: Vancouverian Alpine Cliff, Scree & Other Rock Vegetation

<u>Group</u>: North Pacific Alpine and Subalpine Bedrock and Scree <u>Alliance</u>: Carex spectabilis – Dwarf shrub Lithomorphic Vegetation

Classification Confidence Level: 3

Range: This association occurs in the Olympic and Cascade Mountains.

Plots: 22, MORA (0), NOCA (0), OLYM (21), Other (1)

Environmental Description: This association mostly appears at elevations between 1550-1920 m (5110-6300 ft) on all aspects and moderately steep to steep slopes. Mineral soil and exposed rock and bedrock with little moss or lichen cover are often the dominant features of the site.

Vegetation Description: In this sparsely vegetated association Carex spectabilis

is always present but never prominent. Polygonum bistortoides, Luetkea pectinata, Lupinus (arcticus ssp subalpinus, latifolius) and Valeriana sitchensis frequently occur, in equal abundance with Carex spectabilis.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S3S5

<u>Rank Justification</u>: This preliminary association occurs at numerous sites within a limited geographic distribution. Sites are found on secure habitats in protected areas.

Synonyms:

Carex spectabilis -Valeriana; Schreiner 1994 Carex spectabilis -Lupinus; Schreiner 1994

Carex spectabilis-(Phyllodoce glanduliflora-Lupinus sellulus var. lobbii) Fellfield Lithomorphic Vegetation

Showy Sedge-(Yellow Mountain Heather-Donner Lake Lupine) Lithomorphic Vegetation

Acronym: CARSPE-(PHYGLA-LUPSEL)

NatureServe Code: Provisional

Macrogroup: Vancouverian Alpine Cliff, Scree & Other Rock Vegetation

<u>Group</u>: North Pacific Alpine and Subalpine Bedrock and Scree <u>Alliance</u>: Carex spectabilis – Dwarf shrub Lithomorphic Vegetation

Classification Confidence Level: 2

Range: This association occurs at Mount Rainier National Park, the Olympic

Mountains and possibly in the North Cascades.

Plots: 2, MORA (1), NOCA (0), OLYM (1), Other (0)

<u>Environmental Description</u>: This association occurs above treeline (alpine zone) in fellfields with a high cover of surface stones and gravel. Sites are usually southerly facing and relatively gentle slopes with well-drained soils.

Vegetation Description: This sparsely vegetated type is not clearly dominated by

any particular species. Carex spectabilis is always present and is usually the most abundant species. At Mount Rainier, the dwarf-shrub Phyllodoce glanduliflora is typically the next most abundant species. Other typical species include: Phlox diffusa, Penstemon procerus var. tolmiei, Penstemon davidsonii, Lupinus sellulus var. lobbii (=lepidus var. lobbii), Antennaria alpina, and Empetrum nigrum.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This type is distinguished from the preliminary *Carex spectabilis* Lithomorphic association by its occurrence in alpine, fellfield habitats

Conservation Rank: S3

<u>Rank Justification</u>: This association occurs within a limited geographic range and environment. Known sites are in protected areas. Climate change will likely effect this vegetation.

Synonyms:

Carex spectablis - Phyllodoce glanduliflora community; Edwards 1980 Lupinus lepidus-Carex spectabils-Artemisia trifurcata; del Moral 1979 Carex spectabils-Lupinus lepidus-Erigeron aureus; del Moral 1979

Elmera racemosa-(Senecio neowebsteri) Lithomorphic Vegetation

Yellow Coralbells-(Olympic Mountain Ragwort) Lithomorphic Vegetation

Acronym: ELMRAC-(SENNEO) Lithomorphic

NatureServe Code: Preliminary

Macrogroup: Vancouverian Alpine Cliff, Scree & Other Rock Vegetation

<u>Group</u>: North Pacific Alpine and Subalpine Bedrock and Scree <u>Alliance</u>: Carex spectabilis – Dwarf shrub Lithomorphic Vegetation

Classification Confidence Level: 3

Range: This preliminary association occurs in the Olympics Mountains.

Plots: 19, MORA (0), NOCA (0), OLYM (19), Other (0)

Environmental Description: This very sparsely vegetated association can be found on talus slopes and other loose rocky sites. It occurs at elevations between 1485 and 1980 m (4880 and 6500 ft) on moderately steep slopes.

<u>Vegetation Description</u>: Either *Elmera racemosa* (1.4% average cover) or <u>Senecio neowebsteri</u> (2.7% average cover), or both species, occur most

abundantly in the sparse cover. *Epilobium anagallidifolium* occurs at most sites. Other species such as *Carex spectabilis* and *Sedum divergens* occur in trace amounts on some sites. These sites may be described as 'pioneer' or early seral vegetation.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Many plots are legacy plots that represent rare plant (*Senecio neowebsteri*) habitat in the sample data. One Olympic legacy sample (that appears as ELMRAC in synthesis tables) has dense herbaceous vegetation dominated by *Elmera racemosa* (85% cover) and *Athyrium americanum*. It may represent a variant of the *Athyrium americanum-Cryptogramma acrostichoides* (=crispa) Lithomorphic association (CEGL005900) rather than a fully vegetated version of this lithomorphic type. *E. racemosa* without *S. neowebsteri* appears in the Cascades.

Conservation Rank: S2S3

Rank Justification: This preliminary association occurs within restricted environments with few threats. Sites are on protected land.

Synonyms:

Senecio community; Schreiner 1994

<u>Alliance</u>: Delphinum glareosum Lithomorphic Vegetation

Classification Confidence Level: 2

Range: This association is described from the Olympic Mountains and Mount

Rainier National Park.

Plots: 23, MORA (1), NOCA (0), OLYM (22), Other (0)

Environmental Description: This association occurs at high elevations on ridges, talus, scree slopes and bedrock scoured by glaciers. Surface rocks are common and typically in the 2-10 cm (3/4-4 in) size class. It is found on moderately steep, northwest to south-facing slopes.

<u>Vegetation Description</u>: This open to sparse vegetation typically has *Delphinium glareosum* as the most abundant species (average cover 11%) with few constant associates. *Epilobium anagallidifolium, Phacelia hastata,* and *Lomatium martindalei* contribute little cover but are often present.

USFWS Wetland System: Not applicable.

Comments: There has been limited sampling of sparse and lithomorphic vegetation at MORA and NOCA.

Conservation Rank: S3S4

Rank Justification: This association occurs within a restricted range of environments with few threats. Sites are on protected land.

<u>Alliance</u>: *Phlox diffusa - Lomatium martindalei* Lithomorphic Vegetation

Classification Confidence Level: 3

Range: This association is recognized in the Olympic Mountains and may be in the Cascade Mountains.

Plots: 5, MORA (0), NOCA (0), OLYM (5), Other (0)

Environmental Description: This association occurs on moderately steep to steep slopes at high elevations on easterly aspects. Sites are rocky with over 60% ground cover of rocks. Bedrock may be present.

Vegetation Description: Arnica X diversifolia is the most abundant (6% average

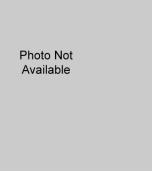

cover) vascular plant in this lithomorphic vegetation type. Although species diversity can be high, only *Achillea millefolium*, *Douglasia laevigata*, *Epilobium anagallidifolium*, *Lomatium martindalei*, *Phlox diffusa*, and *Poa cusickii* show fairly high contancy.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is similar to the *Carex spectabilis - Arnica X diversifolia* alpine association described in Glacier Park, Montana (CEGL005867) although the association described here is nearly lacking *Carex spectabilis*, the diagnositc species of the Rocky Mountain type.

Conservation Rank: S3S4

Rank Justification: This preliminary association occurs within a restricted range with few threats.

Astragalus cottonii Lithomorphic Vegetation

Cotton's Milkvetch Lithomorphic Vegetation

<u>Acronym</u>: ASTCOT Lithomorphic **NatureServe Code**: Preliminary

Macrogroup: Vancouverian Alpine Cliff, Scree & Other Rock Vegetation

Group: North Pacific Alpine and Subalpine Bedrock and Scree

<u>Alliance</u>: Phlox diffusa - Lomatium martindalei Lithomorphic Vegetation

Classification Confidence Level: 2

Range: This association occurs only in the northeastern Olympic Mountains.

Plots: 48, MORA (0), NOCA (0), OLYM (48), Other (0)

Environmental Description: This sparsely vegetated type appears at elevations between 1460 and 1900 m (4800 and 6200 ft) on 16-36% slopes associated with gravelly-sandy, limestone scree. Sites are rocky with some exposed bedrock and mineral soil with a pH 6.0 or higher. Aspects are mostly southwesterly.

Vegetation Description: This lithomorphic vegetation type (average 10% cover)

always contains Astragalus cottonii. Phlox diffusa, Phacelia sericea, and Eriophyllum lanatum are often present.

USFWS Wetland System: Not applicable.

Comments: All plots are legacy plots that represent rare plant (Astragalus cottonii) habitat in the sample data.

Conservation Rank: S4

Rank Justification: This preliminary association occurs within a restricted range by substrate and geography but has few

threats.

Synonyms:

Astragalus community; Schreiner 1994

Dasiphora fruticosa Lithomorphic Vegetation

Shrubby Cinquefoil Lithomorphic Vegetation

<u>Acronym</u>: DASFLO Lithomorphic **NatureServe Code**: Preliminary

Environmental Description: This association occurs in the upper subalpine and alpine zones on rocky substrates.

Vegetation Description: This typically open to sparse

dwarf-shrub association is dominated by *Dasiphora fruticosa* ssp. *floribunda* (=*Potentilla fruticosa*) with *Phlox diffusa*, *Elymus elymoides* and *Carex phaeocephala* as frequent associates. Other constant, low cover species are *Smelowskia calycina*, *Phacelia sericea* and *Erigeron compositus*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association broadly overlaps with the preliminary *Dasiphora fruticosa* ssp. *floribunda* lithomorphic vegetation which is very sparsely vegetated less than 10% over all cover. This association shares landscape setting with *Dasiphora fruticosa* ssp. *floribunda* Subalpine Shrubland (CEGL003499) described in Colorado and New Mexico but differs significantly in associated species.

Conservation Rank: S3S4

Rank Justification: This preliminary association occurs within restricted range of environments on protected land.

Juniperus communis Lithomorphic Vegetation

Common Juniper Lithomorphic Vegetation

<u>Acronym</u>: JUNCOM Lithomorphic NatureServe Code: Preliminary

Macrogroup: Vancouverian Alpine Cliff, Scree & Other Rock Vegetation

Group: North Pacific Alpine and Subalpine Bedrock and Scree

Alliance: Phlox diffusa - Lomatium martindalei Lithomorphic Vegetation

Classification Confidence Level: 3

Range: This association is broadly described from the Olympic Mountains and

likely occurs in the Cascades.

Plots: 25, MORA (0), NOCA (0), OLYM (25), Other (0)

Environmental Description: This association occurs at higher elevations, 1675-1990 m (5500-6500 ft), on steep slopes on most aspects. Rocky slopes with exposed bedrock are characteristic features of these sites.

Vegetation Description: Juniperus communis is the most abundant species (3-

15% cover) in this association. Other species have very low cover (trace to present). *Phlox diffusa* and *Douglasia laevigata* appear with the most constancy (precent of plots). *Penstemon davidsonii*, *F. saximontana* (=ovina var. brevifolia), Carex phaeocephala, Saxifraga bronchialis, Sedum divergens, or Erysimum arenicola are frequently present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is the sparsely vegetated version of the *Juniperus communis-(Phlox diffusa)* association. If this association appears in the Cascades, *Festuca brachyphylla (=ovina* var. *rydbergii)* would be a likely associate.

Conservation Rank: S4S5

<u>Rank Justification</u>: This preliminary association occurs within a narrow range of environments with few threats. Sites are on protected land.

Synonyms:

Juniperus – Phlox community; Schreiner 1994

Luina hypoleuca Lithomorphic Vegetation

Littleleaf Silverback Lithomorphic Vegetation

Acronym: LUIHYP

NatureServe Code: Preliminary

Macrogroup: Vancouverian Alpine Cliff, Scree & Other Rock Vegetation

Group: North Pacific Alpine and Subalpine Bedrock and Scree

Alliance: Phlox diffusa - Lomatium martindalei Lithomorphic Vegetation

Classification Confidence Level: 2

Range: This association occurs in the Olympic and Cascade Mountains.

Plots: 11, MORA (0), NOCA (0), OLYM (11), Other (0)

Environmental Description: This association occurs on steep, gravelly slopes to near vertical cliffs at 1220-1980 m (4000 to 6500 ft) elevation. Aspects are southerly. The soil surface has a high cover of mineral soil, rocks or bedrock and can have an abundance of mosses.

Vegetation Description: This sparse to moderately open vascular plant

association is dominated or co-dominated by *Luina hypoleuca*. *Phlox* frequently co-dominates. Other species frequently present but with low cover include: *Cryptogramma acrostichoides* (=crispa), *Lomatium martindalei*, *Silene parryi*, *Achillea millefolium*, *Sedum divergens*, *Douglasia laevigata*, and *Eucephalus* (=Aster) paucicapitatus. *Paxistima* (=Pachistima) myrsinites is the only shrub that appears frequently but when present, it has low cover.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Part of the variation of the *Pachistima- Sedum* and *Pachistima – Phacelia* community described by Schreiner (1994) is included here.

Conservation Rank: S3S4

<u>Rank Justification</u>: This preliminary association is restricted to a narrow range of habitats. It is represented in many protected areas and has few threats.

Synonyms:

Paxistima myrsinites/Sedum divergens Lithomorphic Vegetation

Oregon boxwood/Pacific Stonecrop Lithomorphic Vegetation

Acronym: PAXMYR/SEDDIV Lithomorphic

NatureServe Code: Preliminary

Macrogroup: Vancouverian Alpine Cliff, Scree & Other Rock Vegetation

Group: North Pacific Alpine and Subalpine Bedrock and Scree

Alliance: Phlox diffusa - Lomatium martindalei Lithomorphic Vegetation

Classification Confidence Level: 3

Range: This association is described in the Olympic Mountains and likely occurs

the Cascades.

Plots: 13, MORA (0), NOCA (0), OLYM (13), Other (0)

Environmental Description: This is a talus and bedrock community. Slopes are southeasterly and moderately steep. Exposed mineral soil, rock and bedrock are characteristic. It is associated with *Abies lasiocarpa* trees near treeline.

Vegetation Description: Paxistima (=Pachistima) myrsinites is most abundant

(average cover 2.5%) and typically grows in cracks in rocks. Sedum divergens may also be abundant (average cover 4%). Phlox diffusa is usually present and can be as abundant as Paxistima. Saxifraga bronchialis, Penstemon davidsonii, Cryptogramma acrostichoides (=crispa), Douglasia laevigata and Erysimum arenicola are frequent associates.

USFWS Wetland System: Not applicable.

Comments:

Conservation Rank: S3S4

<u>Rank Justification</u>: This preliminary association is restricted to a narrow range of habitats. It is represented on many

protected area and has few threats.

Penstemon davidsonii Lithomorphic Vegetation

Davidson's Penstemon Lithomorphic Vegetation

<u>Acronym</u>: PENDAV Lithomorphic **NatureServe Code**: Preliminary

Macrogroup: Vancouverian Alpine Cliff, Scree & Other Rock Vegetation

Group: North Pacific Alpine and Subalpine Bedrock and Scree

<u>Alliance</u>: Phlox diffusa - Lomatium martindalei Lithomorphic Vegetation

Classification Confidence Level: 2

Range: This association occurs in the Olympic and Cascade Mountains.

Plots: 15, MORA (1), NOCA (0), OLYM (14), Other (0)

Environmental Description: This association is found in open, rocky areas such as active and stabilized scree and bedrock. It occurs on moderately steep slopes on all, but most frequently westerly, aspects at mid- to high elevation.

<u>Vegetation Description</u>: Penstemon davidsonii is the most abundant plant in this sparsely vegetated association. *Phlox diffusa* is the most frequent associate.

Erysimum arenicola, Douglasia laevigata, and Lomatium martindalei also occur, but with low cover. Mosses/lichen cover can be prominent on more stabilized sites.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Part of the variation of the *Juniperus–Phlox* community described by Schreiner (1994) is included here.

Conservation Rank: S4

<u>Rank Justification</u>: This preliminary association is restricted to a narrow range of habitats, is represented in many protected areas, and has few threats.

Petrophyton hendersonii Lithomorphic Vegetation

Olympic Rockmat Lithomorphic Vegetation

Acronym: PETHEN

NatureServe Code: Provisional

Macrogroup: Vancouverian Alpine Cliff, Scree & Other Rock Vegetation

Group: North Pacific Alpine and Subalpine Bedrock and Scree

<u>Alliance</u>: Phlox diffusa - Lomatium martindalei Lithomorphic Vegetation

Classification Confidence Level: 3

Range: This association occurs in the Olympic Mountains.

Plots: 4, MORA (0), NOCA (0), OLYM (4), Other (0)

Environmental Description: This association occurs on rocky cliffs and talus

slopes at mid- to high elevations.

<u>Vegetation Description</u>: This is primarily a cliff or rock crevice association with Petrophyton hendersonii occurring most abundantly (average cover 12%). Phlox diffusa, Hedysarum occidentale and Saxifraga bronchialis occur occasionally and

are usually present to prominent.

USFWS Wetland System: Not applicable.

<u>Comments</u>: All plots are legacy plots which represent sampled rare plant (*Petrophyton hendersonii*) habitat. It is,

environmentally, within the variation of the *Pachistima – Sedum* community of Schreiner (1994).

Conservation Rank: S2S3

Rank Justification: This preliminary Olympic endemic association is restricted to a narrow range of habitats, is represented

on protected area, and has few threats.

Phlox diffusa-Allium crenulatum Lithomorphic Vegetation

Spreading Phlox-Olympic Onion Lithomorphic Vegetation

Acronym: PHLDIF-ALLCRE Lithomorphic

NatureServe Code: Preliminary

Macrogroup: Vancouverian Alpine Cliff, Scree & Other Rock Vegetation

Group: North Pacific Alpine and Subalpine Bedrock and Scree

Alliance: Phlox diffusa - Lomatium martindalei Lithomorphic Vegetation

Classification Confidence Level: 3

Range: This association occurs in the northeast Olympic Mountains.

Plots: 10, MORA (0), NOCA (0), OLYM (10), Other (0)

Environmental Description: This association occurs mostly in the subalpine on steep to moderately steep slopes. Mineral soil and rock are common with frequent exposed bedrock.

<u>Vegetation Description</u>: *Phlox diffusa* and *Allium crenulatum* are the most abundant species in this sparsely vegetated association (3% and 5% average

cover respectively). Festuca roemeri (=idahoensis) is frequently present in similar abundance as the two indicator species. Other common species are Lomatium martindalei, Campanula rotundifolia, and Elymus elymoides.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association is related to the preliminary *Phlox diffusa* Lithomorphic Vegetation differing primarily in the species listed above.

Conservation Rank: S3

Rank Justification: This preliminary association occurs at few sites, is represented on protected areas and has few threats.

Synonyms:

Phlox-Festuca community, Schreiner 1994

Phlox diffusa Lithomorphic Vegetation

Spreading Phlox Lithomorphic Vegetation

<u>Acronym</u>: PHLDIF Lithomorphic NatureServe Code: Preliminary

Macrogroup: Vancouverian Alpine Cliff, Scree & Other Rock Vegetation

Group: North Pacific Alpine and Subalpine Bedrock and Scree

Alliance: Phlox diffusa - Lomatium martindalei Lithomorphic Vegetation

Classification Confidence Level: 3

Range: This association occurs in the Olympic Mountains and very likely may

occur in the Cascades.

Plots: 34, MORA (0), NOCA (0), OLYM (34), Other (0)

Environmental Description: This association occurs on a range of harsh sites including: cliff faces, talus, and scree slopes between 1520-2040 m (5000 and 6700 ft) elevation.

Vegetation Description: Phlox diffusa is the most abundant plant (3% average

cover) in the sparse vegetation. Diversity and cover are generally low in this association. *Douglasia laevigata* and *Paxistima* (=Pachistima) myrsinites are frequently present.

USFWS Wetland System: Not applicable.

<u>Comments</u>: Documented plots are from high elevations. With additional sampling, this concept may apply to lower elevation sparsely vegetated sites containing few species other than *Phlox diffusa*.

Conservation Rank: S4

Rank Justification: This preliminary association occurs at many sites, is represented on protected areas and has few threats.

Saxifraga bronchialis Lithomorphic Vegetation

Yellowdot Saxifrage Lithomorphic Vegetation

<u>Acronym</u>: SAXBRO Lithomorphic NatureServe Code: Provisional

Macrogroup: Vancouverian Alpine Cliff, Scree & Other Rock Vegetation

Group: North Pacific Alpine and Subalpine Bedrock and Scree

Alliance: Phlox diffusa - Lomatium martindalei Lithomorphic Vegetation

Classification Confidence Level: 2

Range: This association is described from the Olympic Mountains and very likely

occurs in the Cascade Mountains.

Plots: 3, MORA (0), NOCA (0), OLYM (3), Other ()

Environmental Description: This rock association occurs near treeline at midelevations on moderately steep slopes. Bedrock and exposed rock are

characteristic of these sites.

Vegetation Description: Saxifraga bronchialis is the most abundant species in

this sparsely vegetated association (average 5% total cover). Phlox diffusa, Sedum divergens, Achillea millefolium and

Douglasia laevigata frequently appear with low prominence.

USFWS Wetland System: Not applicable.

Comments: Part of the variation of the Juniperus-Phlox community described by Schreiner (1994) is included here.

Conservation Rank: S2S4

Rank Justification: This preliminary association appears to have a narrow geographic and environmental range but occurs on

habitats with few threats.

Poa stenantha-Cerastium arvense Lithomorphic Vegetation

Northern Bluegrass-Field Chickweed Lithomorphic Vegetation

<u>Acronym</u>: POASTE-CERARV <u>NatureServe Code</u>: Provisional

Macrogroup: Vancouverian Alpine Cliff, Scree & Other Rock Vegetation

Group: North Pacific Alpine and Subalpine Bedrock and Scree

Alliance: Poa stenantha Lithomorphic Vegetation

Classification Confidence Level: 3

Range: This association is described from a single site in the Olympic Mountains.

Plots: 1, MORA (0), NOCA (0), OLYM (1), Other (0)

<u>Environmental Description</u>: This association appears on rock shelves on stable slopes at 1555 m (5100 ft) elevation. Litter and duff is more abundant than exposed rock.

<u>Vegetation Description</u>: This grass-forb community is surrounded by forest. *Poa stenantha, Cerastium arvense*, and *Achillea millefolium* co-dominate the open

vegetation. Trisetum spicatum, Phlox diffusa, Campanula rotundifolia, Poa secunda (=sandbergii), and Montia parvifolia are abundant associates.

USFWS Wetland System: Not applicable.

Comments: This tentative association is represented by a single Olympic legacy plot and more sampling is needed.

Conservation Rank: SUQ

Rank Justification: Insufficient information exists to rank this tentative association.

Polygonum minimum-Racomitrium elongatum Lithomorphic Vegetation

Broadleaf Knotweed-Racomitrium Moss Lithomorphic Vegetation

Acronym: POLMIN-RACELO Lithomorphic

NatureServe Code: Provisional

Macrogroup: Vancouverian Alpine Cliff, Scree & Other Rock Vegetation

<u>Group</u>: North Pacific Alpine and Subalpine Bedrock and Scree <u>Alliance</u>: *Racomitrium elongatum* Lithomorphic Vegetation.

Classification Confidence Level: 3

 $\underline{\textbf{Range}}\text{: This association is described from one plot sampled at Mount}$

Rainier National Park.

Plots: 1, MORA (1), NOCA (0), OLYM (0), Other (0)

Environmental Description: This single plot is a small bald located on

bedrock sloping down to a river.

<u>Vegetation Description</u>: This association is a moss-dominated community of almost exclusively *Racomitrium elongatum*. It is also sparsely vegetated by vascular plants *Polygonum minimum* and *Sedum divergens*. The bald is surrounded by forests of *Abies amabilis* and *Cupressus* (=Chamaecyparis) nootkatensis.

USFWS Wetland System: Not applicable.

 $\underline{\underline{\textbf{Comments}}}. \ \textbf{This is a mapping plot that may provisionally represent all}$

moss-dominated rock balds.

Conservation Rank: SUQ

Rank Justification: Insufficient information exists to rank this provisional type.

Saxifraga tolmiei-Luzula piperi Lithomorphic Vegetation

Tolmie's Saxifrage-Piper's Woodrush Lithomorphic Vegetation

Acronym: SAXTOL-(LUZPIP) Lithomorphic

NatureServe Code: CEGL001986

Macrogroup: Vancouverian Alpine Cliff, Scree & Other

Rock Vegetation

Group: North Pacific Alpine and Subalpine Bedrock and

Scree

Alliance: Saxifraga tolmiei Lithomorphic Vegetation

Classification Confidence Level: 2

Range: This association occurs in the Cascade and

Olympic Mountains.

Plots: 11, MORA (3), NOCA (0), OLYM (5), Other (3)

Environmental Description: This association occurs at high elevations on snowbed sites with a very long-lasting snowpack. In subalpine parklands, the association tends to occur on north-facing slopes. In the alpine zone, above treeline, the association occurs on gentle to moderate slopes with a greater variety of aspects.

<u>Vegetation Description</u>: The vegetation is sparse, less than 25% total cover, and is characterized by the prominence of *Saxifraga tolmiei. Luzula piperi* is usually present to prominent in the North Cascades but is less frequent at Mount Rainier. *Luetkea pectinata, Carex spectabilis, Carex nigricans* or *Juncus drummondii* are usually present but are less abundant than *Saxifraga tolmiei* or *Luzula piperi*.

USFWS Wetland System: Not applicable.

<u>Comments</u>: This association and the *Luetkea pectinata - Saxifraga tolmiei* Herbaceous Vegetation (CEGL001918) are similar and may represent the same association.

Conservation Rank: S4

Rank Justification: This association appears to have a narrow environmental range but occurs on habitats with few threats. Climate change will likely effect this vegetation.

Appendix B. Preliminary key to wetland and riparian plant associations of the Mount Rainier, North Cascades and Olympic National Parks.

Forested, scrub-shrub, and herbaceous wetlands and riparian areas are often highly diverse in species composition and vegetation pattern, and are very often complex in their spatial pattern on the landscape. Patches of homogeneous vegetation are typically quite small. Sampling therefore requires a large number of plots. Because wetlands have not been the subject of much vegetation sampling in these parks to date, currently little data exists upon which to base a vegetation classification. However, likely wetland and riparian plant associations in MORA, NOCA and OLYM are described from adjacent areas.

The following is a preliminary key and includes expected associations for MORA, NOCA and OLYM with the exception of Lake Chelan NRA. The key also includes riparian and wetland associations included in Appendix A with a cross-reference back to that document for each type. The key is arranged by major wetland ecosystem types. Brief bullets are included on how to identify each type, which park it may occur in, and number of plots in parks and NatureServe Code and state rank, if present.

KEY TO PLANT ASSOCIATIONS OF MOUNT RAINIER, NORTH CASCADES, AND OLYMPIC NATIONAL PARKS

Instructions:

- 1. Select a relatively uniform area of vegetation and topography to key out. A representative 1/10 acre plot is a simple way to examine a stand, just be sure the plot represents the stand of interest.
- 2. "Present" means the species is typically found on a representative 1/10 acre plot, i.e. it regularly occurs in the stand.
- 3. If the stand or plot meets the criteria in a line, then read to the right or (if blank) to the next indented line down. If the stand or plot does not meet the criteria, then go to the next line down that is not indented from the current line.
- 4. Some associations key to multiple different lines. For associations that may be distinguished by any one of a number of different characteristics, the criteria are broken into multiple lines so as to avoid excessive and confusing use of "and" and "or" statements. Go to the next line down if the criteria is not met.
- 5. Percentage values refer to crown cover, that is, the vertical projection below the entire crown of the plant, do not subtract for spaces between leaves and branches
- 6. "+" = add the crown cover of each of the species indicated, e.g. 7+22 = 29% cover, overlap between the species gets counted twice. One species may be absent.
- 7. The key is not the classification. After you have keyed out a stand, always read the association description of vegetation composition, geographic distribution, and physical environment. If it sounds like it fits in most regards, you have made a correct identification. If there are multiple inconsistencies between the stand and the description, the key probably was incorrect. In this case, you probably need to try the key again and follow slightly different leads or identify the stand by reading the descriptions. There are also many undescribed communities in the area and the key does not deal with non-forested wetlands or riparian communities for the most part, so the vegetation you are looking at may be an undescribed type.
- 8. Park where the association is located or likely located is listed at each selection as MORA, NOCA or OLYM.

KEY TO PHYSIOGNOMIC CATEGORIES: (page numbers refer to key)

Herbaceous Vegetation > 25%

	Site occurs in a landform where surface water accumulates or groundwater discharges (e.g. marsh, wet meadow, fen, or aquatic bed); may be near late-lying snowbeds; water table near, at, or above soil surface for significant portion of growing season; soil very moist to saturated, although may be dry in late summer/early fall; organic soils may be present;
	Key to Herbaceous Wetland Types, p. 11
	Site occurs in an upland environment (steep slopes, rocky and/or well-drained soils, other areas where surface and/or groundwater do not affect vegetation); may be near early melting snowbeds; soils are rarely saturated (and if so, only in early spring) but can be moist; organic soils or even organic soil horizons not present;

KEY TO PRELIMINARY HERBACEOUS WETLAND TYPES

Site has organic soils; standing water, if present, rarely more than a few inches above the soil surface; soils are typically saturated year-round; some sites may have hummocks; Sphagnum or "brown" mosses may be abundant; Graminoids typically dominate but forbs can be abundant; Characteristic species include Carex aquatilis var. dives, C. utriculata, C. livida, C. nigricans, C. limosa, C. lenticularis, C. interior, C. utriculata, C. exsiccata, Dulichium arundinaceum, Eleocharis quinqueflora, E. palustris, Trichophorum caespitosum, Rhynchospora alba, Eriophorum spp., Comarum palustre, Calamagrostis canadensis, Menyanthes trifoliata., and Caltha leptosepala. **Key to Bog or Fen Vegetation, p. 15**

Site has mineral soils; seasonal standing water may be present early in the growing season; sites typically dry out by late summer/early fall. However, early season flooding or soil saturation result in distinctive wetland vegetation; forbs are typically more abundant than previous, however graminoids can be dominant. **Key to Wet Meadow Vegetation; p. 21**

Site has mineral soils; soils are moist and rarely wet (except potentially early spring); fine-textured soils, snow deposition, or windswept dry conditions limit tree establishment; forbs are often abundant. **Key to mesic meadows; see Herbaceous Upland Vegetation Appendix A**

Appendix C. Synthesis tables of plant associations sampled at Mount Rainier, North Cascades including the Chelan National Recreation Area, and Olympic National Parks.

Appendix C summarizes vegetation samples of plant associations from Mount Rainier, North Cascades and Olympic National Parks into a synthesis table format. The synthesis table displays plant associations in columns and species in rows. Values in table cells are constancy (percent of plots a species occurs in, represented as a decimal, i.e. 0.97 = 97%) and relative average cover (mean cover of a species in the plots in which it occurs in, expressed as percent, i.e. 97.00 = 97%) of selected tree, shrub and herbaceous species for each plant association. The table was generated from VPro (MacKenzie and Klaussen 1999). Plant association names appear by their acronym (the first three letter of genus and species, for example ACEMAC = Acer macrophyllum) as listed below and in plant association descriptions in Appendix A. Plant associations in synthesis tables are arranged by the NVC hierarchy, as listed below and in the "Table of Contents" in Appendix A. This is the first application of the 2008 NVC hierarchy (FGDC 2008) to a NPS classification and consequently, the hierarchical organization of the associations in this report is expected to change. The arrangement listed below reflects the hierarchical status developed by NatureServe and partners as of March 31, 2009. Future changes in the classification hierarchy will be available from NatureServe (http://www.natureserve.org/explorer/index.htm) as modified. Each table is headed by Class and associations are blocked by Group. Changes in shading in the table heading indicate changes in hierarchy level. The order in which associations appear in the following synthesis tables is listed below. The number along the right indicates NVC hierarchical level: 1= Class, 2=Subclass, 3=Formation, 4=Division, 5=Macrogroup, 6=Group, 7=Alliance.

Appendix D. Environmental variables of plant associations sampled at Mount Rainier, North Cascades, and Olympic National Parks.

Appendix D summarizes selected environmental variables sampled with plant associations of Mount Rainier, North Cascades including the Chelan National Recreation Area, and Olympic National Parks. Plant association names appear by their acronym (the first three letter of genus and species, for example **ACEMAC** = *Acer macrophyllum*) as listed below and in plant association descriptions in Appendix A. Plant associations in tables are arranged by the NVC hierarchy as listed in Appendix C and in the "Table of Contents" in Appendix A. The table was generated from VPro (MacKenzie and Klaussen 1999). The tables provide minimum, mean and maximum values for elevation (feet), aspect with number of plots in parentheses in eight classes, for example, NE (4), E (3), N (5), slope gradient of sample (degrees), percent cover of the surface of organic material, rocks, decayed wood, mineral soil and bedrock, and total percent cover of all vascular plants, the tree layer, herbaceous layer and moss/lichen layer. Park Service samples estimated Topographic Moisture (see Methods) and that estimate is provided as well. The number of missing values in a category is listed within parenthesis following Null. Empty cell indicates no data for that variable.

Appendix D: Environmental Table of Forest and Woodland associations. Values in cells are Maximum -- Mean -- Minimum.

Appendix E. Legacy plot data evaluated at Mount Rainier, North Cascades including the Chelan National Recreation Area, and Olympic National Parks.

Appendix E summarizes acquired legacy plot data from Mount Rainier, North Cascades, and Olympic National Parks. The criteria used to evaluate plot data as appropriate for classification analysis include: 1) a near complete vascular species list, 2) plot size scaled to vegetation type (e.g larger for forests), and 3) cover values for all vascular species. See Methods section of document for details.

Park	Project Name	Citation/Contact	Met Criteria?	Comments
NOCA	Vegetation Cover Types of the North Cascades	J.K Agee and S.G. Pickford 1985. Vegetation and Fuel Mapping of North Cascades National Park Service Complex. NPS CPSU, College of Forest Resources, UW, Seattle, WA 98185	No	Top eight species recorded in cover classes
OLYM	West Twin and Hoh Lake Study	Edmonds, R.L, R.D. Blew, J.L Marra, J. Blew, A.K. Barg, G. Murray, T.B. Thomas. 1998. Vegetation patterns, hydrology, and water chemistry in small watersheds in the Hoh River Valley, Olympic National Park. Scientific Monograph. NPSD/NRUSGS/NRSM-98/02. United States Department of the Interior, National Park Service.	No	No cover data for trees, only basal area and density
MORA	Edward Thesis Data	The Alpine Vegetation of Mount Rainier National Park: Structure, development and contraints. Ph. D University of Washington, 1980. 280pp	No	Summary tables in thesis, plot data has been destroyed
OLYM	Gavin Thesis Data	Gavin, Daniel. 1997. Soil pollen records of a subalpine meadow in the northeastern Olympic Mountains, Washington. Master's Thesis. University of Washington.	No	Plots too small
MORA	Henderson Thesis Data		No	No plot locations available for data at time of analysis
NOCA	NPS NOCA Amphibian study	R. Holmes, NPS, unpublished data	No	Understory species list incomplete
NOCA	NPS NOCA Arthropod Surveys	R. Holmes, NPS, unpublished data	No	Plots too small- no tree cover recorded
MORA, NOCA, OLYM	PMR Vegetation and Landform Database Development Study	National Park Service Pacific Northwest Region Vegetation and Landform Database Development Study Final Report. 1996. 65pp	No	Top three species recorded
OLYM	deFerrari Exotics Study	Deferrari, C; Naiman, R A . 1994. multi- scale assessment of the occurrence of exotic plants on the Olympic Peninsula, Washington. Journal of Vegetation Science 5: 247- 258	No	Sampling focus on exotic species
OLYM	Lezberg Thesis data	Lezberg, A.L. 1998. Survival of herbaceous species after canopy closure: role of below-ground traits. Master of Science Thesis. University of Washington.	No	Understory cover in 100m2 plots, canopy structure

Park	Project Name	Citation/Contact	Met Criteria?	Comments
OLYM	Ozette Survey	Gill, S. Botanical survey of the northwest Olympic Peninsula, Washington. 1983. Washington State University. Pullman, WA. 150 pp	No	Species list but no cover values, largely outside OLYM
OLYM	NPS Forest Carnivore Study	P. Happe, NPS, unpublished data	No	
OLYM	NPS OLYM Coastal Wetland Inventory	S. Acker, NPS, unpublished data	No	Species list but cover in broad categories
OLYM	USGS/NPS OLYM Deer Telemetry Data	K. Jenkins, USGS, unpublished data	No	Top 4 species recorded by physiognomic group
OLYM	USGS/NPS OLYM Bat Habitat Survey	K. Jenkins, USGS, unpublished data	No	Canopy cover by PMR structure classes, understory cover
NOCA	Grizzly Bear Habitat	Almack, J.A., W.L. Gaines, R.H. Naney, P.H. Morrison, J.R. Eby, G.F. Wooten, M.C. Snyder, S.H. Fitkin, E.R. Garcia (1993). North Cascades Grizzly Bear Ecosystem Evaluation. Report to the Interagency Grizzly Bear Committee in fulfillment of requirements identified in the 1982 Grizzly Bear Recovery Plan	No	Sampling stratified on spectra, not clear if homogeneous areas consistently sampled
NOCA, OLYM	Glew Thesis Data	Glew, K. 1998. Distribution and Diversity of Alpine lichens: Biotic and abiotic factors influencing Alpine lichen communities in the northeast Olympic and North Cascade Mountains. Ph. D. Dissertation. University of Washington.	No	Plot size too small
NOCA, OLYM	Climet Ecoplot Data	D. Peterson http://wa-node.gis.washingt	tc No	Understory cover, canopy structure
NOCA	NRCS Plot data from Thunder Valley	C. Briggs, NRCS, unpublished data	No	Top three species recorded
NOCA	Susan Pritchard Thesis data	Prichard, S.J. 2003. Spatial and Temporal Dynamics of Fire and Vegetation Change in Thunder Creek Watershed, North Cascades National Park, Washington. Ph.D. Dissertation, University of Washington, Seattle.	No	Canopy structure only

Appendix G. Sampling instructions and field forms used at Mount Rainier, North Cascades including the Chelan National Recreation Area, and Olympic National Parks.

<u>A Basic Guide for Field Work</u> USGS/NPS Vegetation Mapping Program

Instructions for filling out fields

A: IDENTIFICATION AND LOCATION

Park: OLYM, NOCA or MORA

Plot Number: Code indicating the specific plot. We will use a 2 letter code to indicate the general type of vegetation, followed by a plot number. If you are working in teams of two, coordinate with the crew leader to determine if you are using odd or even numbers for the plots.

R- recon (MR, NR and OR for park) DS- dwarf shrubland DF- deciduous forest H- herbaceous

CF- conifer forest/woodland BS- bryophyte and sparse

S- shrubland O- other

Survey Date: Date the survey was taken; day, month, year (07)

Surveyors: Names or initials of surveyors **Watershed:** Name of drainage, if known.

Provisional Association Name:

Using the 2007 draft classification, assign the name of the vegetation type that most closely resembles the type you are surveying. In fact, *none* of the names may be a good fit; you may have found a new type. If you have a new type, circle **new?** and create a provisional name with the dominant and diagnostic species.

Name notes: Record any comments about the choice of name, whether selected from the description or created in the field.

Key worked?: Y. - Circle yes if you could key out the association with little or no difficulty. Indicate in the notes any feedback on using the key.

Description good?: Y. Circle yes if you feel that the description completely reflects the overstory and generally reflects the understory species. Match the descriptive words (sometimes, always, predominate, etc) to the cover of the species in the plots. Indicate in the notes any <u>major</u> differences between the description and what you find on the ground.

Field UTM X and UTM Y (YOU MUST RECORD THIS IN THE FIELD!!!!!!)

Use GPS if at all possible. If you can't get a GPS reading, estimate coordinates from a topo map and note on the form that this method was used. A *minimum* of 100 collection points or three minutes of collection is a general guideline.

GPS Error: Note the error in the GPS reading off the unit. If you are using the Mobilemapper you do not need to fill this in.

PDOP: Note the average PDOP for the time you have been collecting the point.

Plot type: Enter CIRC for circular, SQUAR for square, RECT for rectangular and IRREG for irregularly shaped plot.

Plot Length and Plot Width

For the classification plots, enter the radius for circular plots and width and length dimensions for square or rectangular plots. Choose the appropriate plot size based on the following:

If you're in a	You should usually	plot area of
	make your plot	(min plot area)
Forest/Woodland (i.e., trees have their crowns overlapping, usually	11.3 m radius OR	400 m^2
forming 60-100% cover)	20 m x 20 m	(200 m^2)
Subalpine Parkland (i.e., open stands of trees with crowns usually not touching.	8.0 m radius OR	200 m^2
Mosaiced vegetation	14 x 14 or 10x20	(100 m^2)
Shrubland (i.e., shrubs greater than 0.5 m tall are dominant, usually forming more	5.6 m radius OR	100 m ²

than 25% cover OR exceeding tree, dwarf-shrub, herb, and nonvascular cover)	10 m x 10 m	(50 m^2)
Dwarf-shrubland (heath) (i.e., Shrubs less than 0.5 m tall are dominant, usually	4.0 m radius OR	50 m^2
forming more than 25% cover OR exceeding tree, shrub, herb, and nonvascular cover).	7.1 x 7.1 or 5x 10	(25 m^2)
Herbaceous (i.e., Herbs dominant, usually forming more than 25 percent cover OR	4.0 m radius OR	50 m^2
exceeding tree, shrub, dwarf-shrub, and nonvascular cover).	7.1 x 7.1 or 5x 10	(25 m^2)
Sparse vegetation (i.e., less than 10% vegetation cover)	4.0m radius OR	50 m^2
	7.1 x 7.1 or 5x 10	(25 m^2)
Nonvascular (i.e., nonvascular cover dominant, usually forming more than 25%	2.8 m radius OR	25 m^2
cover).	5 m x 5 m	(10 m^2)

If you are on a slope greater than about 25% you will need to correct the plot size to account for the slope. The easiest thing is to use the Impulse to measure the plot radius because it automatically corrects for slope. Or, you can use the slope correction table to determine the expansion factor needed. Slope distance = horizontal distance * Expansion factor

Slope Correction Table: Slope distance = horizontal distance * Expansion factor

% Slope	EF	% Slope	EF	% Slope	EF	% Slope	EF
5	1.000	42	1.085	79	1.275	116	1.532
6	1.001	43	1.089	80	1.281	117	1.539

Photographs taken? Circle Y for yes and note the (i) numbers and/or time stamp of each photo.

Directions to Plot

Give general directions to the plot using landmarks (e.g., a named point on the topo map, road, trail or structure) readily locatable on a 7.5 minute topo map. Give distances and bearings if possible. Do not take more than a couple of minutes to fill this out.

B. ENVIRONMENTAL FEATURES. Evaluate the features from the center of the plot:

Aspect (degrees)

Measure the slope aspect using a compass which has been pre-set to an average declination for the park.

Slope: Measure the slope in % using a clinometer or the Impulse. Measure to the top of the plot, then to the bottom and take the average of the two measurements.

Elevation: Elevation of the plot. Specify whether in feet or meters (this will depend on the units used on the GPS or on the topographic map being used).

Elevation Source: Circle whether you used GPS, Altimeter, Map or GIS to determine the elevation.

Landform: Enter the landform from the table below that best describes the site.

LANDFORM (from J. Reidel)

- High elevation landforms (primarily erosional in genesis)

 $\mathbf{H} = \underline{\mathbf{Horn}}$, summit ringed by circues with no evidence of overriding by Cordilleran Ice Sheet

A = Arete, ridge with jagged form, not modified by CIS

 $\mathbf{C} = \text{Cirque}$, glacial landform with flat floor and amphitheater shape

O = Other, lower summit modified by CIS

 $\mathbf{R} = \underline{\text{Ridge top}}$, lower elevation with rounded form, modified by CIS

 $\mathbf{P} = \text{Pass}$, low point between horns and aretes

LM= <u>Little Ice age moraine</u>. Ridge of till deposited by glacier movement from 700-100 yrs bp.

PG= Patterned ground.

PK= <u>Parkland</u> (MORA only) gentle terrain surrounded by steeper.

-Valley slope landforms (primarily erosional genesis)

VW = Valley Wall

 $\mathbf{RC} = \underline{\mathbf{River Canyon}}$ - Vshaped valley incised in bedrock

 $\mathbf{BB} = \underline{\mathbf{Bedrock\ Bench}}$, glacial landform found along lower valley walls at junctions of glaciated valleys, ass. with small rock falls and topples

-Transitional landforms between valley slope (erosion) and valley floor (deposition).

MM-A = <u>Debris avalanche</u>, large landslide includes rock and debris

MM-F = <u>Rock Falls or Topple</u>- accumulation of falling rock in single events. Usually void.

MM-DA = <u>Rock and debris</u> avalanches (large size, rapid)

MM-S = Slumps and Creeps- landslide of saturated ground material.

MM-SG= Sackung- fissures or spreading at ridgetops

MM-DT = Debris Torrents- channelized debris flow, usually void.

DA = Debris Apron- zone of debris accumulation at base of slope

DC = Debris Cones (inactive part of debris torrent, slopes >10⁰, often have levees, large boulders, on 1st and 2nd order tributaries

Elwha specific: PD= Perched delta- relict delta formed under past Lake Elwha conditions. **PDC**- perched debris cone.

PDCT- Perched debris cone terrace

-Valley bottom landforms (primarily depositional genesis)

FP = Floodplain, valley floor to elevation 4000 ft.

VB = Valley Bottom, valley floor 'flats' above 4000 ft.,where floodplain and associated cut and fill terraces are absent

T = Terraces- flat surface that grades downstream.

FT = Alluvial Fan Terrace, relict parts of alluvial fans that stand above the active fan surface

SAIL= snow avalanche impact landform

L= Lahar

DF= debris fan-located where stream gradient decreases

D= delta- fan shaped deposit where stream meets still water

SH= shoreline

 $\mathbf{AF} = \text{Alluvial Fan, large tributaries, surface slopes} < 5^{\circ}$

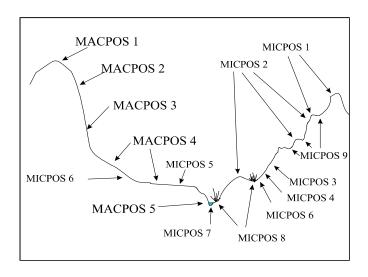

M = Glacial Moraines

PM = Pleistocene Moraine- ridge of till deposited by glacier

-Other landforms

U = Undifferentiated, usually glacial drift

Co = Coast

Macroposition (MACROPOS) – the landscape containing the plot relative to the features at the mountain scale

1 = ridgetop

3 = midslope

5 = bottom

2 = upperslope

4 = lower slope

Microposition (MICROPOS) the landscape in the near vicinity of the plot

1 = ridgetop

4 = lower 1/3

7 = river bottom

2 = upper 1/3

5 = bench, flat

8 = edge of or in basin or wetland

3 = mid 1/3

6 =toe of slope

9 = draw, intermittent stream bottom

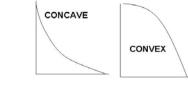

Microconfiguration (MCONFIGv = vertical which is the same direction as the aspect and the slope measurements and MCONFIGh = horizontal is perpendicular to the slope and parallel to the contour.)

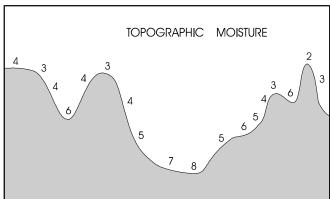

$$1 = convex$$

$$2 = straight$$

$$3 = concave$$

4 = undulating

Topographic Moisture TM= redistribution of water by gravity (values in 0.1)

Topographic moisture is a concept used to describe and analyze the movement or redistribution of water by gravity through the soil and bedrock (Henderson et al. 1992). As precipitation is absorbed by litter or soil, it is immediately affected by the downward pull of gravity. The water in the soil that is free to move is therefore redistributed downward

from ridgetops, steep slopes and convex surfaces to lower slopes, toeslopes and valley bottoms. **Consider this redistribution as unaffected by aspect, vegetation type or soil type**. It is evaluated at the mountain scale. We use a scale from 1-9 where a "1" represents a very dry site where water immediately begins moving downhill. At the other extreme is code "9" which represents a body of open water. TM code 5 represents a modal site where the effect of topography results in neither an accumulation nor deficit of soil water. This coding system is illustrated in the figure above, and examples are shown in the table below. Record values to 0.1 units, **but don't use even halves** (e.g. 4.5, 5.5). Note that the range 4-5 actually includes values 3.6 to 5.4.

1 = extremely dry (ridgetop) 6 = moist mesic

2 = very dry 7 = moist, well-watered

3 = dry, well-drained 8 = wet

4 = dry mesic 9 = standing water

5 = mesic

Environmental notes: If you had any questions about filling in any environmental features, please indicate them here.

Soil Description (Classification plots only): Dig a small hole in a representative area of the plot. Record the depth of each horizon and color (dry and moist). If substrate is organic muck or peat, record that on form instead of soil texture. Record the % of rock fragments (greater than 2mm). Fill in the hole when done.

Horizon	Criteria
О	Organic soil materials other than limnic materials. The mineral fraction is commonly a small percent by volume and is less than 80% by weight. The O horizon INCLUDES the duff layer. There is typically no O horizon in grasslands.
A	Mineral soil, formed at surface or below O, little remnant rock structure with a recognizable accumulation of humified organic matter but dominated by mineral matter. Excludes recent eolian or alluvial deposits that retain stratification. The humified material in A horizons often color the horizon a dark color (brown
Е	The 'E' horizon gets its E from the word Eluvial (emigrated out of). It is a horizon of mineral soil that has leached out (lost) clay, iron, aluminum, and/or organic matter, leaving a net concentration of sand and silt; little remnant rock structure; typically lighter color (higher value chroma) and coarser texture than A. E horizon is a feature of Spodosols. In Spodosols, the E horizon is usually grey or white, and is a common horizon in coniferous forests at middle to upper elevations. Do not confuse E horizons with layers of ash from volcanic eruptions. Ash layers in soil can be identified by placing grains from the horizon between one's teeth. The mineral grains of ash are glass, and can be chewed into smaller particles. Sand cannot be broken down into smaller particles and will resist chewing.
В	B horizons are dominated by mineral soil but have some soil development. They typically formed below O, A, or E; little or no rock structure; and one or more of the following: 1) illuvial (downward migration from upper layers) accumulation of silicate clay, Fe, Al, humus, carbonate, gypsum, silica, or salt more soluble than gypsum (one or more); 2) removal of carbonates, gypsum or more soluble salts; 3) residual accumulation of sesquioxides (aluminum-oxygen molecule); 4) sesquioxide coatings; 5) alterations that form silicate clays or liberates oxides and forms pedogenic structure; 6) Strong gleying (red or grey spots mixed with clay) in the presence of aquic (inundated by water) conditions (or artificial drainage); Layers with gleying, but no other pedogenic change are not B horizons. Most B horizons are or were subsurface horizons. Some formed at the surface by accumulation of evaporites. Cemented and brittle layers that have other evidence of pedogenesis are included as B horizons.
С	C horizons are mineral soil or soft bedrock with no soil development. The layer is little affected by pedogenesis and lack properties of O, A, E, or B horizons. This horizon is in its original form from when it first appeared at the site (when it was originally deposited, or uplifted, etc). May or may not be related to parent material of the developed soil horizons. C horizons are usually devoid of biological activity
R	Hard bedrock. Unbroken rock.
TRANSITIONAL	Transitional horizons have characteristics of the horizons above and below the horizon.
AB	For example: a horizon with some characteristics of the A horizon above it AND
BA	characteristics from the B horizon below it would be designated an AB horizon. If this
BC Etc	horizon is designated a BA, then it signifies that the transitional horizon is dominated by
Etc	characteristics from the adjacent B horizon.

MOIST CAST TEST:

Place a small amount of soil in the palm of your hand and moisten. Soil is at the proper consistency when it is moldable like putty. Attempt to form a ball or rod. Toss the cast from hand to hand to test for strength.

RIBBON TEST:

Moist soil is kneaded, by hand then rolled into a rod shape. Squeeze the soil between the thumb and forefinger to form the thinnest ribbon possible. Form a ribbon of uniform thickness and width. Allow the ribbon to extend over the forefinger and break from its own weight.

FEEL TEST:

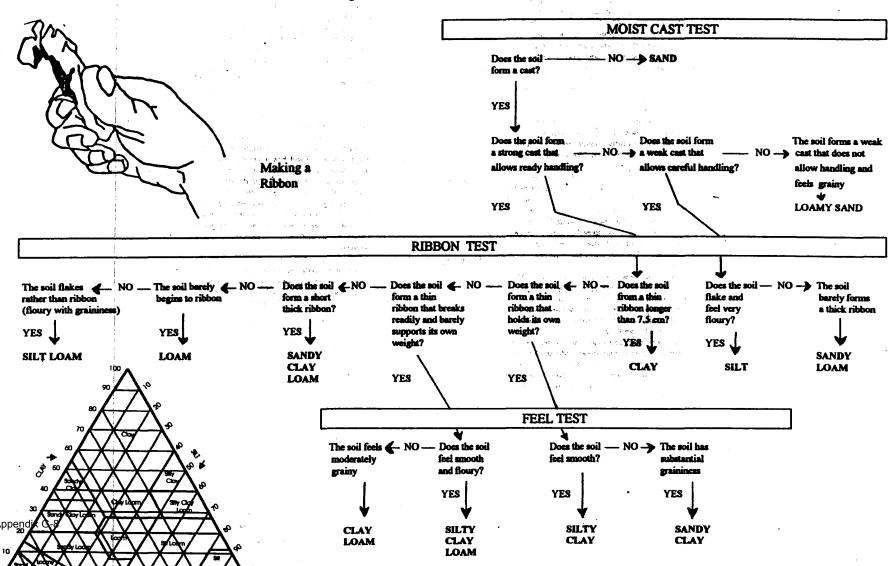

The soil is rubbed between the thumb and forefinger to feel for its coarseness or fineness. Sand has a grainy feel, silt feels floury and clay, feels very smooth

TASTE TEST:

Carefully chew a small amount of soil to test for volcanic ash. If the soil particles break when you chew, then the soil has volcanic glass in it.

HEAR TEST:

Fine sand can be detected by listening to a small amount of soil as you rub it.

Ground Cover

Estimate ground cover using the four broad classes by each category. Visual cover estimates should sum to 100%, however the cover class totals may not. In cases where moss, lichen or litter covers rocks or logs, ignore its cover and record just the total cover of the rocks or logs.

BILLY'S MOSS FLOWCHART

Classification Plot:

Ground Cover Section-

Moss counts EXCEPT on logs and rocks

Vegetation Description-

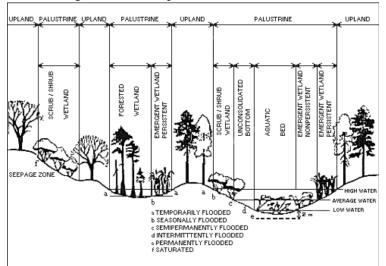

Moss counts on logs on ground, horizontal trees, under other plants and on rocks but NOT ON AERIAL LOGS

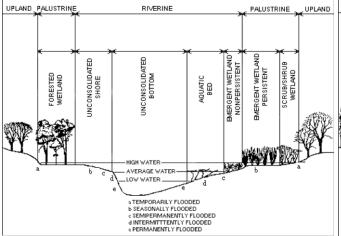

Ocular Observation-

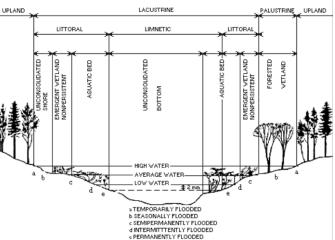

Moss counts on ground and rocks NOT on logs

Cowardin System

Is water an important control on the vegetation of this plot?

Circle "upland" if the system is not a wetland. If the system is a wetland, circle the name of the Cowardin system, subsystem and class that best describes it.

Palustrine= inland marshes, swamps, bogs, fens, tundra and floodplains. Systems lack flowing water and contain ocean derived salts in concentrations of less than .05%. It also includes the small, shallow, permanent or intermittent water bodies often called ponds. Palustrine wetlands may be situated shoreward of lakes, river channels, or estuaries; on river floodplains; in isolated catchments; or on slopes. They may also occur as islands in lakes or rivers. Classes for this system include: **Moss-Lichen Wetland, Emergent Wetland, Scrub-Shrub Wetland, and Forested Wetland**.

Moss-Lichen - mosses or lichens cover substrates other than rock and emergents, shrubs, or trees make up less than 30% of the cover. The only water regime is saturated

Emergent - characterized by erect, rooted, herbaceous hydrophytes, excluding mosses and lichens. This vegetation is present for most of the growing season in most years. These wetlands are usually dominated by perennial plants. All water regimes are included except subtidal and irregularly exposed.

Scrub-Shrub - dominated by woody vegetation less than 6 m (20 feet) tall. The species include true shrubs, young trees, and trees or shrubs that are small or stunted because of environmental conditions. All water regimes except subtidal are included.

Forested - by woody vegetation that is 6 m tall or taller. All water regimes are included except subtidal.

Lacustrine= Lake-associated wetlands including lakeshores, freshwater marshes, and aquatic beds as well as lakeshores. Subsystems are limnetic or deep water and **littoral**, or shoreward habitats with **emergent** wetland vegetation (non-persistant) being the only class with vegetation.

Riverine= fed by water flowing through a channel, includes river banks, streams, freshwater marshes, and freshwater aquatic beds. Subclasses include intermittant, upper and **lower perennial** and tidal. Only **lower perennial** subclasses can have **emergent** wetland vegetation (non-persistant).

Hydrologic Regime: (adapted from Cowardin et al. 1979).

Permanently Flooded - Water covers the land surface at all times of the year in all years.

Semipermanently Flooded - Surface water persists throughout growing season in most years except in years of extreme drought. When surface water is absent, the water table is usually at or very near the land surface. Land surface is normally saturated when water level drops below soil surface.

Seasonally Flooded - Surface water is present for extended periods during the growing season, especially *early in the growing season*, but is *absent by the end of the growing season* in most years. The water table after flooding ceases is very variable, extending from saturated to a water table well below the ground surface. When surface water is absent, the water table is often near the land surface.

Temporarily Flooded - Surface water present for brief periods during growing season, but water table usually lies well below soil surface for most of the season. Often characterizes flood-plain wetlands. Plants that grow both in uplands and wetlands are characteristic of the temporarily flooded regime.

Intermittently Flooded - Substrate is usually exposed, but surface water can be present for variable periods without detectable seasonal periodicity. Inundation is not predictable to a given season and is dependent upon highly localized rain storms. *Weeks, months, or even years may intervene between periods of inundation.* This modifier was developed for use in the arid West for water regimes of Playa lakes, intermittent streams, and dry washes but can be used in other parts of the U.S. where appropriate. This modifier can be applied to both wetland and non-wetland situations.

Saturated - Surface water is seldom present, but substrate is saturated to surface for extended periods during the growing season.

Disturbance

Comment on any evidence of natural or anthropogenic disturbance and specify the source.e.g. plant pathogens, fire scars on the trees or other evidence of fire.

Animal Use Evidence

Comment on any evidence of use of the plot by animal. Identify scat (bear, elk, deer, hare) by genus. Be on the look out for tree peeling, tree holes, ground holes, antler rubs, browse or grazing. Note any unusual wildlife sightings, for example larger birds, rapters, reptiles or amphibians.

General Site Description: Write a word-picture of the plot, including information about landscape features, species composition, unique or unusual features etc.

C. VEGETATION DESCRIPTION

Physiognomic Class Choose one:

Forest- Trees with their crowns overlapping (generally forming 60-100% cover).

Woodland- Open stands of trees with crowns not usually touching (generally forming 25-60% cover). Canopy tree

cover may be less than 25% in cases where it exceeds shrub, dwarf-shrub, herb, and nonvascular cover,

respectively.

Shrubland- Shrubs generally greater than 0.5 m tall with individuals or clumps overlapping to not touching (generally

forming more than 25% cover, trees generally less than 25% cover). Shrub cover may be less than 25% where it exceeds tree, dwarf-shrub, herb, and nonvascular cover, respectively. Vegetation dominated by

woody vines is generally treated in this class.

Dwarf-Shrubland- Low-growing shrubs usually **under 0.5 m tall**. Individuals or clumps overlapping to not touching

(generally forming more than 25% cover, trees and tall shrubs generally less than 25% cover). Dwarf-shrub

cover may be less than 25% where it exceeds tree, shrub, herb, and nonvascular cover, respectively

Herbaceous- Herbs (graminoids, forbs, and ferns) dominant (generally forming at least 25% cover; trees, shrubs, and

dwarf-shrubs generally with less than 25% cover). Herb cover may be less than 25% where it exceeds tree,

shrub, dwarf-shrub, and nonvascular cover, respectively.

Nonvascular - Nonvascular cover (bryophytes, non-crustose lichens, and algae) dominant (generally forming at least 25%

cover). Nonvascular cover may be less than 25% where it exceeds tree, shrub, dwarf-shrub, and herb cover,

respectively.

Sparse Vegetation- Abiotic substrate features dominant. Vegetation is scattered to nearly absent and generally restricted to

areas of concentrated resources (total vegetation cover is typically less than 10% and greater than 0%).

Leaf Type

Select one value which best describes the leaf form of the dominant stratum. The dominant stratum is the uppermost stratum that contains at least 10% cover.

Broad-Leaved - Woody vegetation primarily broad-leaved (generally contributes greater than 50 percent of the

total woody cover).

Needle-Leaved - Woody vegetation primarily needle-leaved (generally contributes greater than 50 percent cover).

Microphyllous - Woody cover primarily microphyllous (small leaves as in heather).

Graminoid - Herbaceous vegetation composed of more than 50 percent graminoid/stipe leaf species.

Forb (Broad-Leaf-Herbaceous) - Herbaceous vegetation composed of more than 50% broad-leaf forb

species.

Pteridophyte - Herbaceous vegetation composed of more than 50 percent species with frond or frond-like

leaves.

Leaf Phenology

Select the value which best describes the leaf phenology of the dominant stratum. The dominant stratum is the uppermost stratum that contains at least 10% cover.

Evergreen - Greater than 75% of the total woody cover is never without green foliage.

Deciduous – More than 75% of the total woody cover sheds its foliage in connection with an unfavorable

season mainly characterized by winter frost.

Mixed Evergreen – Evergreen and deciduous species generally contribute 25-75% of the total woody cover.

Deciduous and - cold-deciduous species admixed.

Perennial - Herbaceous vegetation composed of more than 50% perennial species.

Annual - Herbaceous vegetation composed of more than 50% annual species.

CLASSIFICATION FORM:

Strata/Lifeform, Cover, Height, Species

These data provide a gross picture of the structure and composition of the vegetation. Visually divide the community into the vegetation layers (strata) indicated on the form. Indicate the average height class of the stratum in the first column, using the Height Scale on the form. This should be the average height of the **top** of the canopy. Enter the average percent cover class of the whole stratum in the second column, using the Cover Scale on the form.

Herbaceous layers are H1 = Graminoids (grass, sedge, rush), H2 = Forbs (Dicot herbaceous), H3 = Ferns and Fern allies, and H4 tree seedlings. List the dominant species in each stratum, and list them in order of abundance. If species known to be diagnostic of a particular vegetation type are present, list these as well, marking them with an asterisk.

N- Nonvascular plants in this category should be counted on the logs which lie on the ground, horizontal trees and under other plants.

V- Vine/liana. Two genera in our region: (Clematis and Lonicera)

E-Epiphytes- Two in particular that may be common: Selaginella sp. and also Polypodium glycyrrhiza (licorice fern). **Estimate their cover as though they had been laid out flat on the ground**.

Tree species can have cover in all strata, except for the dwarf shrub strata. Trees between 0 and .5m should be indicated in the H4 tree seedling class.

Instructions for filling out fields in the Ocular Species Data Form

Starting with the uppermost stratum, list all the species present and the height class (HT) and canopy cover class (CCC) of each species. Use the 14 point scale located on the Ocular Species Form for the cover. For the tree species, record cover and height separately for the regen ($S < 5 \, \text{m}$) vs taller ($T > 5 \, \text{m}$) tree layer.

Trees are defined as single- or few-stemmed woody plants, generally greater than 5 m in height and 10 cm DBH at maturity and under optimal growing conditions. Individuals can be determined relatively easily. Emergent trees are obviously taller than the main canopy. The top of the crowns of trees in the subcanopy layer must be lower than the average height of the bottom of the live layer of the canopy layer, with only infrequent overlap. Shrubs are defined as multiple-stemmed woody plants generally less than 5 m in height at maturity and under optimal growing conditions, and determining individuals can sometimes be difficult.

For species that are not identified in the field, collect and label with appropriate name (e.g. Carex spp #1). Write Y in column when voucher species is collected for later identification. Collect moss, liverwort and lichen vouchers using bryophyte envelopes, filling out appropriate details, especially noting the substrate on which the sample was growing. Remember to keep liverworts refrigerated/and or cool as much as possible. It may be easier to estimate the total cover for the mosses and lichens and then divide that cover by the cover for each species.

Use the critical areas table to help determine what the area covered by a given percent of either a circular or a square plot. For example, 10% of a 400 m2 circular plot is a circle with a diameter of 7.14 m. Measure your own armspan, which may be close to 1% of a 400 m2 circular plot.

Critical Are	as of Diffe	erent Plot S	izes.

Tips for estimating cover:

Cover is the percent of an area (usually a plot) which is occupied by the crowns of an individual species. To determine the area occupied by an individual plant, mentally connect the outer portions of the crown with a line, thus making a polygon. Do not subtract for small areas between leaves or small gaps between branches. Project this polygon to the ground as if it were a shadow. Determine the area of this "shadow" or determine the total area of all the "shadows" of the plants of each species. Convert this area to a percentage of the plot. This is percent cover.

There are numerous ways to estimate cover of a species on a plot. First determine the size of the plot. Begin by choosing one of the dominant species on the plot. Estimate cover for this species very carefully using one or more of the following methods:

- 1. Quickly estimate whether the species covers more or less than 50% of the plot; then more or less than 24% or 75% of the plot:
 - if the species is greater than 75% use methods 5, 6
 - if the species is 25-75% use methods 3, 4, 5, 6
 - if the species is less than 25% use methods 2, 3, 4.
- 2. Measure or estimate areas which are 1% and 10% of the plot. **See table above.** Many types key out on the basis of whether a species is more or less than 10%, so this is a critical area. For species near this amount of cover, mentally try to fill a 10% area with plants so that their crowns don't overlap. For species with low cover in the plot, it is often useful to try to mentally fill a one percent area. If you fill the one percent area with plants and still have plants left over, fill another. This would give you 2%. Or if there are still some plants left over, fill another, and so on.
- 3. Measure the actual area covered by individual plants or clumps. This works well for large or clumpy plants such as vine maple, oceanspray or trees. For example given a large clump of vine maple, measure a typical radius of the clump and convert to area.
- 4. Measure or estimate the size of a typical individual of a species and then count the individuals of that species. This works well for small to medium-sized plants such as swordfern or beargrass. If the typical swordfern on a plot was 1/2 of one percent (1.6m radius) and there were 24 plants, the cover for swordfern would be 12%.
- 5. Estimate the area <u>not</u> covered by a species. Use this method when a species has more than 75% cover. Use methods 2, 3, or 4 but apply them to areas not covered by a species. This often works well for dense salal. For example, if there are 4 openings in a plot which are not occupied by salal and each has a radius of about 2 m (2 x 2 x 3.14 = 12.6 m2 = 3.2% of 400m2 there would be 3.2 *4= 12.8 percent of the area which is not salal or 87.2 percent salal.

- 6. Divide the plot into quarters or halves if the species is very unevenly distributed or if the plot is large. If you divide a plot into quarters estimate each quarter separately then **average** the four quarters together. If most of the plants of one species fall in one of the quarters, mentally try to fill in the holes with plants from the other quarters.
- 7. Check your cover estimates by:
 - a. comparing each species to one that you are relatively certain about
 - b. comparing estimates on the same species done by different methods
 - c. comparing to someone else's estimate

Instructions for filling out fields in the Fuels Data Form

Fuels Data Form- LIVE FUELS page 1

Visualize the cover by strata. Remember that T1 Emergent trees stick out above the main canopy, and will not be found in many forest types. The T3 Subcanopy trees are at least 5 m tall but whose tops are found below the average lowest height of the main canopy, without much overlap. The T2 Canopy consists of everything below the emergent trees and above the subcanopy trees, and thus, is the predominant canopy strata. T4 Regen trees are those that are less than 5 m tall, including small seedlings. The moss and lichen strata do not include those that are growing on upright trees. Estimate the total cover and average height for each stratum. **Cover values are in 1% categories up to 5, then in 5% categories.** Starting from the center of the plot, select the closest 5 trees per stratum for the T1, T2 and T3 Strata. Record the six letter species code, DBH, height, and height to live crown. **Units should be metric.** Height to live crown is measured at the lowest point of the lowest branch where the foliage is continuous to the top. The lowest point of an upward-growing branch is the node where it meets the bole, the lowest point of a downward-growing branch may touch the ground. Within each stratum, count the number of trees by species and record in the tally column. Tally and record the cover and height by species rather than by individual plants within the T4 Regen stratum. Use the "Others" column to list multiple species. If there is an exceptionally large number of trees to tally (e.g. >100 regen) then tally within a subset of the plot and record the sampling area in the notes.

Check box indicates the presence of ladder fuels. Typical ladder fuels are moss and lichen on the trees and dead branches. They can also include adjacent shrubs and seedlings. Ladder fuels are a continuous fuel that starts within 1-2 feet of the ground and can carry fire to within 1-2 feet of the canopy. If there are vertical gaps greater than 1 - 2 feet then the site would not have ladder fuels, unless the composition or organization of materials/brush/shrubs/etc. is dense enough to create flames greater than 1 - 2 feet. When in doubt about the ability of something to be a ladder fuel, assume that it is. 50% of the plot should be affected by ladder fuels to be checked Y.

Fuel model:

Select one of the 13 fuel models.

Jackpots:

Jackpots are unusual accumulations of downed woody debris, of larger diameter that represent larger sources of fuel for a fire. They are found most often on steep slopes. Record the jackpot tally and their average length, width and height.

Snag class tally. Record the number of snags in each class, their average DBH and height. Snags must be taller than DBH (1.47m).

Snag Class:

- 1- Trees that have died recently and retain most of their bark and most of their branches; the top is intact. Very little decay has occurred in the wood, unless the tree had heart-rot decay when it was living.
- **2-** Snags that have been dead at least several years and have lost some branches and some bark (except for grand fir and Douglasfir, which tend to retain their bark after death); tops are often broken; there is some evidence of decay.
- **3-** Snags that have been dead a long time and lack branches and bark (except for grand fir and Douglas-fir, which tend to retain their bark after death). Tops are broken off and the sapwood and heartwood are extensively decayed.

Fuels Data Form- DEAD AND DOWN FUELS page 2

Definitions:

Litter- Includes freshly fallen leaves, needles, bark, flakes, fruits (e.g cones), cone scales, dead matted grass, and a variety of miscellaneous vegetative parts. Does NOT include twigs and larger stems. Litter lies above the live moss layer and is NOT attached to standing trees or shrubs.

Duff- The fermentation and humus layers; does NOT include the freshly cast material of the litter layer. The top of the duff is where the needles, leaves fruits etc have noticeably begun to decompose. The bottom of the duff is the mineral soil. Duff is further split into **upper duff**, where plant parts are still largely recognizable and the **lower duff**, where they are not.

Fuel Loading - Dead and Down

For each plot, surveyors will estimate the loadings of **dead and downed** fuels using a modified Brown's transect. Transects are **50 ft in length** and the **height of the sampling plane is up to 2m**. To locate the plot, use the azimuth table, and follow that azimuth from the center until you are at the plot edge. Then, take 47+ the back azimuth (third column) and walk the tape out 50 ft. Take a second random azimuth from the plot center and repeat for the second transect. Record the slope (from the top to the bottom of the tape) and aspect (of the landscape on which plot is located) of each transect. The transect can be off the ground, but should generally follow the contour of the ground. On slopes, the measurement should occur straight down, not perpendicular to the slope.

The dead and downed fuels are classified into three types based on the diameter of the fuels. The fuels should be sampled by looking straight down over the tape. The diameter can be readily measured with the Go-No-Go (GNG) gauge. For ease of data collection in this project we have numbered the types. Type 1 (1 hr fuels) are from 0 to .25 inch in diameter. Type 2 (10 hr fuels) consist of dead branch wood between 0.25 and 1.0 in diameter. Type 3 (100 hr fuels) are 1 - 3 in diameter. A box system for the tally should be used where the corner dots of the box count as one and the lines connecting the corners and sides count as one, so each box counts as 10.

The last category is fuels larger than 3 inch diameter, which can be rotten=r or sound= s and are measured the entire length of the transect.

Tally the type one and two fuels in the first 6 feet.

Tally the type three fuels in the first 12 feet

Record the diameter of the 3+ r and 3+s to nearest tenth of inch

The tally rules for the downed woody material are as follows:

- Do not count dead woody stems and branches still attached to standing or horizontal but rooted shrubs and trees
- Do not count twigs and branches when the intersection between the central axis of the particle and the sampling plane lies in the duff
- If the sampling plane intersects the end of a piece, tally only if the central axis is crossed
- Do not tally any particle having a central axis that coincides perfectly with the sampling plane
- If the sampling plane intersects a curved piece more than once, tally EACH intersection
- Tally uprooted stumps and roots not encased in dirt. Do not tally undisturbed stumps
- For rotten logs that have fallen apart, visually construct a cylinder containing the rotten material and estimate its diameter
- Do measure through rotten logs whose central axis is in the duff layer

After you have finished the downed wood sampling, return along the transect sampling the litter and duff depths and derivation (explanation below).

Litter and Duff

Take measurements at 5, 15, 25, 35 and 45 ft along the transect

The litter is the freshly fallen dead material at the top of the forest floor. Record the arrangement of the litter-normal, fluffy or perched. Perched is generally grass type litter only that is not fully on the forest floor. Fluffy would refer to litter such as from a fern frond. Record the litter type- humic vs peat-derived.

At each sampling point, gently insert a trowel or knife into the ground until you hit mineral soil, then carefully pull away exposing the litter/duff profile. Locate the boundary between the litter and the LOWER duff layers. Vertically measure the litter and the duff to the nearest tenth of an inch. Further divide the duff layer into upper and lower duff and record to

nearest tenth of inch. Record the depth and derivation. Unless you are in an area with peat forming Sphagnum mosses, the derivation for the upper duff will be dead moss/litter and the lower duff will be humus/muck.

The measurement rules for litter and duff are as follows:

- Do not include twigs and larger stems in the depth measurements
- If there is moss at the point of measurement, measure the duff from the base of the green portion of the moss.
- If there is a tree, stump or large rock at the point, record the litter or duff as zero, even if there is litter or duff on top of the stump or rock
- Refill the holes
- If a log is in the middle of a litter or duff measuring point, move the collection point one foot over to the right, perpendicular to the sampling plane

CLASSIFICATION PLOT SAMPLING PRIORITIES FOR 2007 (R. Crawford)

High Priority

Alpine /sparsely vegetated areas

Shrublands (dominated by shrubs taller than 0.5 m tall) anywhere, uplands higher priority than wetlands

Vegetation in Avalanche Chutes distinctly different than surrounding forests

Douglas-fir forests west of the Cascade Crest with no or little western hemlock or western redcedar (<10% cover) and that do not key to any of the described associations

Subalpine parkland tree islands/stringers west of the Cascade Crest

Forests/woodlands in the Ross Lake area of NOCA dominated or co-dominated by Douglas-fir, ponderosa pine, and/or lodgepole pine

Western redcedar dominated upland (not wetlands we have that pretty well covered) stands, where redcedar dominates often with western hemlock but not much if any Douglas-fir, especially if covering a substantial area (most likely on outer coast and in moist valley bottoms). Don't worry about small inclusions (local canopy variation) in broader types.

Herbaceous or dwarf-shrub "balds" west of the Cascade Crest. Low to middle elevations (not subalpine) dry openings in forest, usually with shallow soils, south to west aspects, and/or dry topographic position. Can have vernally wet seeps that dry out in late summer. (Herbaceous balds are those open, convex features on the valley wall with shallow soils, exposed becdrock and low vegetation and moss).

Dry grasslands below the subalpine zone

Any association mentioned in the preliminary classification as needing more data or better clarification

Medium Priority

Riparian forests (riverine floodplain or terraces) that do not fit existing provided descriptions or names in preliminary classification

Non-forested wetlands, especially middle elevations

Ponderosa pine dominated stands in Lake Chelan NRA

Bigleaf maple stands in Lake Chelan NRA

LASER RANGE FINDER

Safety: avoid looking directly at laser, never point the instrument directly at the sun, do not expose to extreme temp.

On: Button on right side closest to you

Off: Two buttons (simultaneously), left side furthest from you

Fire button: Same as "On" button. Will take measurement or select menu item.

To Scroll through menu: Either of two buttons, right side furthest from you – forward and back.

Cross-hair scope: Simply press Fire button to take a measurement.

Red dot scope: First press Fire button to activate the red dot, then press Fire button to take measurement. Red dot will disappear after 15 seconds. Re-press Fire button to reactivate the red dot. To increase intensity of the red dot, use middle left button.

High-pitched single beep: measurement was not taken, try again.

High-pitched double beep: measurement was taken. Fast ticking: instrument is trying to lock onto a target.

Measurement point: Measurements are taken from the middle of the laser, at the tripod attachment point (offset of '0'). This is also the pivot point for tree height calculations. If using the laser as a hand-held instrument, the 'offset' should be calibrated to the user (usually the back of the user's head) if measurements are to be accurate. To make this adjustment, see "height pivot offset" below. Note: 1) this offset only affects tree ht measurements. 2) any time the units are changed (see "change units" below) offset will be reset to 0.

To Measure Distance: HD on the screen (top near center) indicates that you are ready to take horizontal distance, (VD = vertical distance, SD = slope distance (use scroll buttons)). Aim at object and press the Fire button to get reading. F or M to the right of the number indicates whether the distance is in ft. or meters (to change, see "change units" below).

To Measure Tree Height: HT on the screen (top left) indicates that you are ready to take horizontal distance to the tree. If possible, stand at a distance from the tree that gives you an angle less than 50 degrees when shooting to the top of the tree. Aim first at a reflector that is held directly beside the tree, at the center of its girth. Press fire button for horizontal distance (remember that the first push may simply reactivate the red dot). Downward arrow indicates that you are ready to take a reading to the base of the tree. Aim and hit fire button. Upward arrow indicates that you are ready to take a reading to the top of the tree/crown. Aim and hit fire button. (Note: this only takes an angle reading, so measure where you think the top of the tree is, rather than where you can see it.) Hit fire button again for calculation of tree height.

Filter on: 'filter on' is for use with the reflector. Range finder will only pick up signals from a highly reflective surface in this mode. **Filter off:** reading taken from any object that the laser bounces off. The reflector can also be used.

Turning filter on or off: scroll to "SYS", press fire button, press fire button to turn filter off or on, press the button furthest away from you to save the setting.

Change units: Note: this change will affect values stored in memory, including offset. Scroll through SYS systems menu; when UNITS indicator is flashing and SEL shows in numeric display area, press fire to toggle between options, and press forward most button to select, continue for degrees, gradients and %, press back twice to accept new settings and return to main menu.

Height Pivot Offset: Go to SYS option indicator, press 'fire' to select, press forward until the PIVOT indicator begins blinking (lower left), HT is displayed in top left, and current offset value is blinking. Use two forward buttons to edit the offset value in whole ft or meters. Advance to the next digit using the left fire button. Long-press the back key to reset to 0. When the value is correct, press the fire button. Press forward or back to exit the edit mode. PIVOT in the lower screen of the HT option indicates a pivot offset.

"Gates" can be set to create a limited range in which a distance will be measured. Go to GATE indicator, press Fire, press Fire to turn Gate on or off, press middle button to enter the "short" distance (as done in pivot offset), or set by pressing Fire at chosen distance; press middle button and enter the "long" distance if desired. At end or any time press furthest button to back out to main menu. To clear Gate, long-press furthest button when Gate value is shown, or enter in 0 for Gate value.

KODAK EASYSHARE DX7590

Description

The Kodak EasyShare DX7590 is a 5.0 megapixel (MP) camera. Photos taken at the maximum 5.0 mp mode produce pictures that can be enlarged to 20" X 30", and produce photos that take up as much as 2 MB of memory once transferred to the computer. The camera can also shoot photos at 4.4 MP, 4.0 MP, 3.1 MP, and 1.8 MP. Our project generally will not require shooting 5.0 MP photos, so **shoot at 4.0 or 3.1 MP** (see "setting photo quality").

LCD SCREEN and the VIEWFINDER

To turn on or off the LCD screen push the lone button in the upper left corner of the back of the camera labeled EVF/LCD. The camera has a nice LCD screen, but any LCD screen can be deceptive when focusing. It is usually better to focus using the viewfinder. To use the view finder just turn off the LCD screen. Using the LCD screen will also drain the batteries faster than using the viewfinder. Only the LCD screen allows you to view photos already taken.

CAMERA MODES

There are several camera modes, which are selected primarily by using the "power ring" on the back of the camera. There is also the "flower" mode and the "landscape" mode, turned on using the right, middle button on the top of the camera. For our purposes, we will mostly be using the **automatic**, **A** (aperture), **landscape** or **flower** modes. The modes on the power ring control the camera shutter speeds, focus, and ISO. The flower and landscape modes interact with the power ring modes relative to the mode selected. It would be nice to simply use the automatic mode, but unfortunately, we will have to use the A mode in order to shoot in low light situations, so it is important to familiarize yourself with this mode.

SETTING PHOTO QUALITY

- Select "menu" by pushing the menu button (middle, lower right button on back)
- Use the "joystick" located in the middle of the "power ring" to scroll down (tilt joystick down) to the second option and select by pushing joystick in.
- LCD screen will now show you all of the quality options. Use the joystick to scroll to desired MP and push joystick in to select.
- Exit menu by pushing menu button.

FOCUS and FLASH RANGE

The camera can focus from 4.7" to infinity. Remember that you cannot focus closer than 4.7." The flash is supposed to be good from 2' to 16' while the camera is zoomed out, and good from 6.6' to 12.1' when fully zoomed in.

TAKING A PICTURE

- Make sure the **camera** is **on** and the **lens cap** is **off**.
- **Select the mode** you will be shooting in. This may be a two step process (ie. You may be shooting in automatic mode AND flower mode use the flower mode when photographing plants close-up, and use the landscape mode when photographing scenery far away. For most scenes, neither flower nor landscape mode should be turned on.).
- Frame your photo When you **hold down the shutter button halfway**, the camera will focus on the object in-between the blue []. If you hold down the button for a second or more, green [] will appear, signifying where the focus has been established.
- When the focus desired is established, **completely press down the shutter button**.

IMPORTANT FEATURES

The camera is designed to assist the photographer while taking pictures, so it is important to have the "status" button on. This button is represented by an "i" on the back upper left of the camera. The status button will allow you to see what f-stop and shutter speed you are shooting at, and it will warn you if your focus is off or if the light level is too low for handheld photography.

- If your focus is off, a red AF (automatic focus failed) will appear in the right-hand corner of the LCD screen. This means that you are too close to your subject, or the camera cannot identify a subject to focus on.
- If the light level is too low for handheld photography, (*)) will appear in the upper right corner of the LCD. You may also see AE (automatic exposure failed), which is telling you that the exposure failed (not enough light)

LIGHT SENSITIVTY

This camera has the equivalent light sensitivity to ISO 80-160 when in automatic mode and a range of ISO 80-800 in the other modes. ISO 80-160 means that the camera needs a lot of light to take a picture, not an ideal situation for photographing under dense forest canopies. For low light forest situations, it would be better to shoot using a higher ISO, preferably ISO 400.

To adjust ISO manually:

The ISO can only be manually adjusted when the camera is in P, A, S, M or C modes. The easiest mode to operate in would be the A mode (aperture priority). Once in this mode, be sure that the "status" button is on. Find the "jog dial," which is on the front of the camera, in the upper right corner where the index finger naturally sits. The "jog dial" controls the yellow arrow that scrolls between options in the bottom of the LCD screen.

- Scroll the jog dial to the ISO icon on the right.
- Once the yellow arrow is next to the ISO icon, push in the jog dial to select ISO. You know that ISO is selected when the icon turns yellow.
- Jog the dial right or left to change the ISO.
- When the ISO desired is showing, press the jog dial in to set the camera to that ISO.

MACRO PHOTOGRAPHY

Camera shoots as close as 4.7". This distance can be effective when shooting flowers or plants close-up in the field for identification later in the office. Kodak suggests shooting in "flower" mode whenever objects are closer than 28 inches. "Flower" mode is depicted as a flower on the top of the camera, middle button. If the camera is in automatic mode and flower mode, it automatically shoots in ISO 100, which is ideal for bright light situations, but not ideal for low light situations. To shoot in low light situations, turn the dial to "A" mode (aperature priority), and adjust your ISO to 400. ISO 800 can only be selected when the quality is set at 1.8 MP. Do not use the flash in macro mode.

REVIEWING PHOTOS

- Push the "Review" button in the lower far-right corner on the back of the camera
- To scroll between photos, push the joystick left to go backwards and right to scroll forward.

RECORDING PHOTO NUMBERS IN FIELD

As soon as a photo has been taken, it is crucial that the photo number is recorded onto the field data sheet. There will be hundreds of photographs at the end of the season, so it is essential that the number is recorded in the field.

- Press review button of photo just taken
- Hit the "status" (i) button twice until you see several lines of information appear.
- The "name" or number of the photo will be at the upper left corner of the LCD screen and it will read something like "000_0044.jpg.
- This number can be seen in the computer when the photo is downloaded by either right-clicking on a photo or looking in the upper left corner of the photo when it is opened in "windows picture viewer."

DELETING PHOTOS in the field

- Press the review button (lower far-right button on back)
- Scroll to the picture you want to delete using the joystick.
- Press the delete button
- Scroll to "Picture" to delete the photo on the LCD screen and push in the joystick to initiate the action.
- If you want to delete all photos on the camera, select the "All..." option instead of "Picture," and push in the joystick to initiate the action.
